APPENDICES

Appendix A: Integrated Report Tables

Appendix B: Integrated Report Figures

Appendix C: Metadata and Definitions

Appendix D: Status of Category 4 Waters

Appendix E: IDEM's priority Ranking and 2020-2022 Schedule for Total Maximum Daily Load Development

Appendix F: IDEM's 305(b)/303(d) Monitoring, Assessment, Reporting, and Listing Schedule

Appendix G: IDEM's 2020 Consolidated Assessment and Listing Methodology

Appendix H: Comprehensive Aquatic Life Use and Recreational Use Assessments

Appendix I: Trend and Trophic Status of Indiana's Lakes

Appendix J: IDEM's Notice of Comment Period for the 2020 Draft 303(d) List and Consolidated Assessment and Listing Methodology (CALM)

Appendix K: IDEM's Responses to U.S. EPA's Comments on Indiana's Draft 303(d) List and Consolidated Assessment and Listing Methodology (CALM)
Note: This appendix includes a spreadsheet file available in electronic format only.

Appendix L: Listing Tables Including Indiana's Finalized 303(d) List of Impaired Waters (Category 5) for 2020
Note: This appendix is available in electronic format only.

Appendix M: Indiana's 2020 Consolidated List (Categories 1-5)
Note: This appendix is a spreadsheet available in electronic format only.

EXECUTIVE SUMMARY

Section 305(b) of the federal Clean Water Act (CWA) requires states to prepare and submit a report on the water quality condition of state water resources to the U.S. Environmental Protection Agency (U.S. EPA) every two years. States are also required to develop and submit a list of impaired waters to U.S. EPA for approval under CWA Section 303(d). Indiana Department of Environmental Management (IDEM) meets both of these requirements with the submittal of this Integrated Water Monitoring and Assessment Report (IR) to U.S. EPA in even-numbered years.

To develop this report, IDEM used data collected by the agency in accordance with its 2017-2021 *Surface Water Quality Monitoring Strategy* and data from other agencies and organizations where possible. IDEM's strategy describes three primary approaches to monitoring Indiana surface waters. Probabilistic monitoring employs a stratified random sampling design on a nine-year rotating basin schedule, which provides a comprehensive statewide data set for assessments every nine years. Targeted monitoring designs involve the intentional selection of sampling locations based on specific monitoring objectives such as reassessments for Total Maximum Daily Load (TMDL) reports. IDEM's fixed station monitoring is another type of targeted monitoring for which the locations do not change except in rare circumstances. IDEM monitors its fixed station sites year-round, collecting water chemistry samples on a monthly basis.

IDEM reviews all the data it collects for use in making CWA Section 305(b) water quality assessment and Section 303(d) listing decisions and considers existing data from external organizations where it is readily available and meets the agency's data quality requirements. IDEM follows the methods and procedures in its Consolidated Assessment and Listing Methodology (CALM) to make its CWA water quality assessment and listing decisions. The purpose of IDEM's CWA assessments is to determine whether Indiana waters are meeting their designated uses described in Indiana's water quality standards (WQS).

Indiana's WQS provide the basis for the methods and procedures described in the CALM and the water quality criteria that Indiana waters must meet to ensure they are supporting their designated uses. Of the uses designated in the state's water quality standards, IDEM assesses aquatic life use support, recreational use support, and drinking water use support for surface waters that serve as a public water supply. IDEM also evaluates the degree to which Indiana's lakes and its rivers and streams support fish consumption. Indiana's WQS includes other designated uses, however, IDEM limits its assessments to these three uses and fish consumption because the criteria in place to protect them are more stringent than those necessary to protect other uses. Thus, the criteria used to protect these uses also protect other designated uses covering agricultural and industrial activities, for example.

IDEM completed its first IR in 2002, which provided the first baseline report on water quality throughout the state. IDEM conducts its water quality assessments on a continual basis and updates the IR every two years, submitting the updated reports to U.S. EPA as required by the CWA. The 2020 IR provides the most recent comprehensive report on Indiana water quality to date, including results from IDEM's comprehensive use support assessments. IDEM's Reach Index (the "address book" for streams that allows for mapping them and tracking them for water quality assessment purposes) contains 62,612 miles of streams, which together represent the vast majority of flowing waters in Indiana. Table 1 (Appendix A) summarizes the cumulative results for IDEM's stream-specific assessments. To date, IDEM has assessed approximately 36,814 miles of stream for aquatic life use and has found 67 percent of those to be fully supporting that use. Approximately 27 percent of the 33,599 stream miles assessed support full body contact recreational use. Almost all of Indiana's 67 miles of Lake Michigan shoreline fully supports aquatic life use, while almost none of the shoreline waters support full body contact recreational use.

This report identifies the parameters that IDEM has found to be impairing or indicating impairments of Indiana's flowing waters (rivers and streams) and lakes. The report devotes a separate section for Lake Michigan and another for its shoreline in Indiana. Pathogens continue to be the top cause of stream impairments in Indiana, with impacts to the potential recreational use of more than 24,001 miles of streams. Through its assessments for fish consumption, IDEM has also found that polychlorinated biphenyls (PCBs) in fish tissue affects 4,887 miles of rivers and streams in Indiana while mercury in fish tissue affects 597 miles. IDEM has also found fish with high levels of PCBs and/or mercury in 59 of the 1,578 Indiana lakes that IDEM tracks for assessment purposes, including Lake Michigan. While many of Indiana's rivers and streams support healthy biological communities (fish and aquatic insects), IDEM has found almost 8,816 stream miles that have experienced a measurable adverse response to stressors, many of which remain unknown.

Potential sources affecting Indiana waters include nonpoint sources that affect 13,906 miles of streams, while unknown sources affect at 11,617 miles. IDEM has several programs in place to address nonpoint source pollution. The Nonpoint Source (NPS) Program and the Total Maximum Daily Load (TMDL) Program work towards restoring waters of the State. The NPS Program's watershed specialists promote the holistic watershed approach by working closely with locally led watershed groups.

INTRODUCTION

The federal Clean Water Act (CWA) requires states to prepare and submit a water quality assessment report of state water resources, including a list of impaired waters to the United States Environmental Protection Agency (U.S. EPA) in even-numbered years. Thus, Indiana Department of Environmental Management's (IDEM's) Office of Water Quality (OWQ) publishes the Indiana Integrated Water Quality Monitoring and Assessment Report (IR) every two years. As with previous reports, OWQ prepared the 2020 IR following U.S. EPA guidelines (1997a, 1997b, 2005, 2006b, 2009b, 2011, 2013, 2015, and 2017) to ensure that this report for the 2020 cycle meets all the reporting requirements in Sections 305(b), 303(d) and 314 of the CWA.

Indiana's IR contains two lists, the Consolidated List and the 303(d) List of Impaired Waters. These lists differ in purpose and scope. The Consolidated List provides site-specific water quality assessment information for waterbodies throughout the state of Indiana. The 303(d) List of Impaired Waters provides a subset of these to identify only those waters that are impaired and for which total maximum daily loads (TMDLs) are required per CWA Section 303(d). The IR also provides IDEM's results for its CWA Section 314 assessments of lake trends and trophic state as well as information pertaining to Indiana's ground water and wetland resources.

IDEM bases most of its water quality assessments on data collected by it Watershed Assessment and Planning Branch in the OWQ. IDEM's *Surface Water Quality Monitoring Strategy*, *2017-2021* (WQMS) (IDEM, 2017) describes all of the OWQ monitoring programs that contributed most of the data used to develop this report. Much of that data comes from IDEM's Probabilistic Monitoring Program. The Probabilistic Monitoring Program employs a stratified random sampling (probabilistic) design to generate a representative set of sampling locations for each of nine major watershed management basins defined in IDEM's WQMS (Figure 6, Appendix B). IDEM uses probabilistic results to make comprehensive use support assessments, which are statistically valid statements about the overall water quality within each watershed. IDEM can also use the same data to make site-specific assessments of the individual waterbodies within that basin.

IDEM's targeted monitoring programs also provided much of the data used to develop this report, including results from IDEM's:

- Fixed Station Monitoring Program
- Watershed Characterization Program
- Fish Tissue Contaminant Program
- Performance Measures Monitoring Program
- Cyanobacteria Monitoring Program
- Special Studies Program

IDEM also uses secondary data provided by the Indiana Clean Lakes Program, which conducts sampling on Indiana's lakes and reservoirs through a contractual agreement between IDEM's Nonpoint Source (NPS) Program and Indiana University's O'Neill School of Public and Environmental Affairs.

BACKGROUND

Indiana is located on the eastern edge of the North American great interior plains. The North-South continental divide traverses northern Indiana, dividing the state into two major drainage basins, the Great Lakes basin and the Mississippi River basin. Surface water in the northern one-quarter of the state flows north into the Great Lakes and then through the St. Lawrence River to the Atlantic Ocean. The southern three-quarters of the state drains into the Ohio River or Illinois River, then flows into the Mississippi River, which flows south to the Gulf of Mexico.

Indiana has approximately 63,511 miles of rivers, streams, ditches and drainage ways based on the Indiana Reach Index, which is a map of Indiana waters based on the U.S. Geological Survey's (USGS') high resolution (1:24,000 scale) National Hydrography Dataset (UGSG 2014). Table 2 (Appendix A) provides an atlas of all the different types of waterbodies in Indiana, including those assessed for this report. Appendix C provides the metadata and definitions used in this report.

WATER POLLUTION CONTROL IN INDIANA

Several agencies share authority for controlling water pollution in Indiana. IDEM holds authority to carry out several federal Clean Water Act (CWA) programs, including Sections 402, 305(b), 303(d), 314, and others. The Indiana State Department of Health (ISDH) holds regulatory authority over septic systems, and the Office of the Indiana State Chemist (OISC) regulates pesticides and nutrients. The State Soil Conservation Board (SSCB), Indiana State Department of Agriculture (ISDA), Indiana Department of Natural Resources (IDNR) – including its Lake and River Enhancement (LARE) Program and its Lake Michigan Coastal Program (LMCP) – administer voluntary programs and grant programs to help mitigate various types of nonpoint source pollution. Indiana also collaborates with many federal agencies and nonprofit organizations in order to accomplish its work, including:

- United States Geological Survey (USGS)
- United States Environmental Protection Agency (U.S. EPA)
- United States Department of Agriculture (USDA)
- United States Fish and Wildlife Service (USFWS)
- United States Forest Service (USFS)
- United States Army Corps of Engineers (USACE)
- National Park Service

Universities and other organizations that provide additional research, technical and funding assistance include, Purdue University and its Cooperative Extension Service, Indiana University, The Nature Conservancy, the Indiana Water Monitoring Council, county soil and water conservation districts, and many local non-profit and ad-hoc watershed groups.

IDEM'S WATERSHED APPROACH

The IDEM employs a watershed approach in its CWA programs. This approach is hydrologically defined and geographically focused, providing an effective framework to address water quality issues by taking into account land, air, and water stressors. Key benefits of the watershed approach include the integration of multiple programs through coordination of public, private, and not-for-profit stakeholders and the ability to leverage limited resources to address priority concerns.

The foundation of IDEM's watershed approach is internal and external collaboration across program areas through timely and effective communication and adaptive management. Later sections of this report describe IDEM's work with other state and federal agencies and other external organizations in more detail.

Internally, IDEM's commissioner and other senior staff meet weekly to discuss progress on priorities as well as emerging concerns, and relay this information to IDEM OWQ managers at their weekly meetings. Cross-program teams continually work to develop strategies and work plans that ensure that OWQ focuses its resources on addressing the most significant environmental issues affecting water quality.

IDEM began using a watershed approach in 1996 when the agency adopted a statewide rotating basin approach to watershed monitoring. From 1996-2010, IDEM monitored watersheds throughout the state on a five-year rotation, which provided a complete update for the entire state once every five years.

In 2011, IDEM began using a nine-year rotating basin approach. This approach has provided a comprehensive and updated data set for the entire state as of 2019. The water quality assessments included in this report are cumulative and include all waters assessed to date in every basin of the state. Figure 1 (Appendix B) shows the monitoring locations for all of IDEM's surface water sampling programs and illustrates the sampling density achieved through IDEM's water quality monitoring strategy over the past nine years (2011-2019).

IDEM's OWQ programs work together to protect and improve the quality of Indiana's surface waters. OWQ Water Quality Standards (WQS) program works to develop Indiana's WQS, which provide the foundation for IDEM's implementation of several CWA programs. IDEM's water monitoring programs provide much of the data necessary to conduct CWA Section 305(b) water quality assessments and to support the development of Indiana's 303(d) List of Impaired Waters and total maximum daily loads (TMDLs) required under Section 303(d) of the CWA.

IDEM addresses nonpoint source (NPS) pollution primarily through non-regulatory watershed management planning and implementation projects funded through its NPS Program and supported by the development of TMDLs for impaired waters. The agency's National Pollutant Discharge Elimination System (NPDES) provides a robust regulatory program to control point sources of pollution to Indiana surface waters.

IDEM also works with the Indiana Finance Authority to issue low-cost loans to communities for infrastructure improvements to their wastewater and drinking water facilities. Many of these loans go to municipalities in watersheds where IDEM has identified water quality impairments and where there are TMDLs approved by U.S. EPA. IDEM anticipates that in time, these projects will result in measurable improvements in water quality, and has a water quality monitoring program in place to determine this.

IDEM'S OFFICE OF WATER QUALITY PROGRAMS AND ACTIVITIES

Water Quality Standards Program

IDEM is the state agency responsible for the ongoing development of Indiana's WQS, which can be found online in 327 Indiana Administrative Code (IAC) Article 2 at: www.in.gov/legislative/iac/iac_title?iact=327. Indiana adopted its first WQS in 1986. In 1990, Indiana revised the WQS significantly, adopting numeric criteria for all pollutants for which the United States Environmental Protection Agency (U.S. EPA) had developed federal ambient water quality criteria for the protection of human health and aquatic life.

At that time, Indiana also established the designated uses that Indiana waters should support. Currently, Indiana's WQS designates all waters in the state of Indiana for uses consistent with the requirements of the Clean Water Act or U.S. EPA's implementing regulations, and all have criteria appropriate to determine support of these uses.

With few exceptions, Indiana's WQS have designated all surface waters in the state for warm water aquatic life use, full-body contact recreational use, industrial uses, and agricultural uses. Further, the WQS designate waters that serve as a source water for drinking water treatment facilities as public water supplies. The WQS designate certain waters in Indiana for put-and-take trout fishing where natural temperature conditions will support coldwater fisheries, and 11 stream reaches are designated outstanding state resource waters.

There are 30 reaches of streams in Indiana designated for limited use in Indiana's WQS based on an analyses of an inability to fully support aquatic life use . In 2007, another limited use designation was added to Indiana's WQS and is applicable only to waters receiving wet weather discharges from combined sewer overflows (CSOs) in communities that have an approved CSO Long Term Control Plan (LCTP) in place. Like the limited use designation for aquatic life use, Indiana's WQS require a use attainability analysis prior to changing a waterbody's designation for recreational use to the CSO wet weather limited use. IDEM approved the first use attainability analysis (Indianapolis/CWA Authority) for this use on August 13, 2019. IDEM is currently working on a rulemaking to amend the current use designation in the WQS for the affected waters.

Most waters in Indiana have at least two designated uses or more. Therefore, IDEM uses the most stringent criteria when implementing its programs to ensure that all uses are protected. The most stringent criteria in Indiana's WQS are those established to protect aquatic life use, recreational uses for all Indiana waters and, where applicable, public water supply. IDEM bases its water quality assessments primarily on these uses and the water quality criteria in the WQS established to protect them.

Indiana's surface WQS include both numeric and narrative water quality criteria. Together with designated uses and the state's antidegradation policy and procedures, which Indiana adopted into rule in 2012, Indiana's water quality criteria provide the foundation for the protection of Indiana's water resources. WQS development is an ongoing process, in terms of both the development of numeric water quality criteria and the methods for the implementation of Indiana's narrative criteria.

For example, in the absence of a numeric criterion for polychlorinated biphenyls (PCBs) in fish tissue, IDEM calculated a numeric value for the maximum allowable concentration of PCBs in fish tissue based on U.S. EPA guidance for developing water quality criteria for the protection of human health in 2008. This value allowed IDEM to begin using fish tissue data directly in its assessments of how well Indiana waters support fish consumption instead of relying on the fish consumption advisory published by the Indiana State Department of Health, which is not intended for this purpose. In addition, in 2013, Indiana adopted revised chloride criteria developed by the WQS Program based on hardness and sulfate concentrations.

National Pollutant Discharge Elimination System (NPDES) permits are based, in part, on the procedures and criteria articulated in Indiana's WQS. Indiana made significant revisions to the rules and regulations that guide the implementation of Indiana's WQS through NPDES in 1993. However, these changes resulted in only minor revisions to the water quality criteria expressed in the state's WQS.

With the issuance of the final Great Lakes Water Quality Guidance in 1995, IDEM began the process of revising the WQS and implementation regulations for those waters in Indiana's Great Lakes system. These revisions incorporated the various criteria and procedures identified in the guidance into Indiana's WQS. As a part of this rulemaking, IDEM also developed its original antidegradation policy and procedures applicable to waters in the Great Lakes system. IDEM regulates the drinking water from public water supplies through the Safe Drinking Water Act (SWDA). IDEM defines what constitutes a public water supply based on the SDWA and has established minimum requirements regarding the information included in consumer confidence reports, which public water suppliers deliver to their customers annually. Indiana's surface WQS include criteria to protect public water supplies withdrawn from surface waters (reservoirs, lakes, rivers and streams). However, many public water supplies rely on

water drawn from ground water sources. In 2002, Indiana adopted Ground Water Quality Standards into its WQS to help maintain and protect the quality of Indiana's ground water resources and ensure that exposure to ground water will not pose a threat to human health.

Current Water Quality Standards Development

IDEM is currently working on a rulemaking to revise Indiana's aquatic life and human health ambient water quality criteria for select metals for waters within and outside of the Great Lakes system. The revised criteria reflect updates based on current science, and many are National Recommended Water Quality Criteria (NRWQC) developed under Section 304(a) of the Clean Water Act (CWA).

On March 5, 2014, IDEM issued a first notice in the Indiana Register announcing a rulemaking to incorporate the revised water quality criteria for metals into Indiana's WQS. IDEM issued a Second Notice of Comment Period to seek comments on proposed revised criteria on November 17, 2017. IDEM issued a Notice of Public Hearing to consider preliminary adoption for the draft rule on January 22, 2020. More information about this rulemaking can be found on IDEM's WQS website at: www.in.gov/idem/cleanwater/2329.htm.

IDEM has been evaluating the development of numeric nutrient criteria as requested by the U.S. EPA to support CWA assessments and permit development. U.S. EPA has issued guidance that allows states some flexibility in the development of nutrient criteria if the state and U.S. EPA have agreed on a plan to progress toward this goal. Indiana submitted its nutrient criteria development plan to U.S. EPA in 2009, and U.S. EPA approved it the same year. This plan includes a schedule for criteria development and provides for annual updates to U.S. EPA on IDEM's progress towards meeting nutrient criteria development goals.

IDEM has worked collaboratively with the USGS in Indianapolis over the last 14 years to collect and analyze stream data relevant to the development of nutrient criteria from waters throughout the state. IDEM also contracted with LimnoTech, Incorporated to collect and analyze all available data for Indiana lakes and reservoirs to inform nutrient criteria development. LimnoTech completed its analysis in 2008, after which IDEM performed additional analyses on the data set to refine the nutrient benchmarks developed by LimnoTech. Based on these studies, on June 30, 2010, IDEM issued a first notice in the *Indiana Register* announcing a rulemaking to incorporate numeric water quality criteria for total phosphorus for lakes and reservoirs into Indiana's WQS. Following this first notice, IDEM convened a work group for discussion of a rule. Based on stakeholder concerns regarding impacts of implementing the criteria, the work group determined it was premature to proceed with the second notice.

IDEM has developed a non-rule policy to reduce the amount of nutrients entering Indiana waters from certain NPDES facilities. IDEM is now in the last year of a five year permitting cycle (2015-2020) to include a one milligram per liter (mg/L) total phosphorus discharge limitation in all NPDES permits for major sanitary treatment plants with an average design flow of one million gallons per day or more as permits are renewed. IDEM expects this effort to result in a significant reduction in statewide total phosphorus discharged from sanitary treatment plants. In addition, IDEM is now requiring major sanitary dischargers to begin monitoring for total nitrogen beginning with their next NPDES permit renewal. IDEM is also requiring major dischargers to monitor and report total nitrogen concentration and mass discharged to IDEM on a monthly basis. IDEM plans to use the data collected to develop a better understanding of nitrogen loadings in Indiana waters and to aid in future updates of Indiana's nutrient reduction efforts.

In 2017, using federal CWA Section 106 Monitoring Initiative Funds from U.S. EPA, IDEM implemented a pilot study to provide a better understanding of the complex relationships between nutrients, primary productivity, dissolved oxygen fluxes over a 24-hour period and biological community response indicators in wadeable streams. The study concluded in 2019 providing additional information that may help IDEM establish defensible criteria through change-point analysis. IDEM plans to continue collecting more data in this realm with a focus on condition extremes, land uses, and habitat qualities. IDEM is also working to develop algal metrics, which combined with those for fish communities and macroinvertebrates, will provide three different types of stream biota to correlate with water chemistry data to help determine critical levels of nutrients.

U.S. EPA has announced plans to publish draft NRWQC in 2020 to update the ecoregional numeric nutrient criteria for lakes and reservoirs published in 2000 and 2001. The NRWQC will include models and tools to help states derive criteria based on several stressor-response models developed for aquatic life, full body contact recreation, and public water supply uses. U.S. EPA's models and tools allow for the combination of state and national data sets to calculate state-specific recommendations that reflect local conditions. In 2017, U.S. EPA Headquarters selected Indiana as one of several case studies to demonstrate these models and tools. U.S. EPA will use IDEM's data set for inland lakes to develop its case study after its publication of the NRWQC.

IDEM also participates in the Indiana Conservation Partnership (ICP) and has worked closely with the Indiana State Department of Agriculture (ISDA) on the development of *Indiana's State Nutrient Reduction Strategy* discussed in a later section of this report.

NPDES Wastewater Permitting Program

Point source pollution in Indiana is controlled primarily through permits issued by IDEM for discharges to surface water under the NPDES Permit Program in IDEM's Permits Branch. Regulated facilities that discharge to waters of the state must apply for and receive a NPDES permit. Limitations in each permit are derived to protect all designated and existing uses of the receiving water body and/or any more stringent technology-based limitations that may be applicable to the permittee.

The Permits Branch issues individual (municipal, semi-public and industrial) NPDES permits. The program also issues industrial wastewater pretreatment permits to industries that discharge to municipal wastewater treatment plants. In addition, the Permits Branch issues general permits for:

- Hydrostatic testing of commercial pipelines.
- Non-contact cooling.
- Sand and gravel operations.
- Petroleum product terminals.
- Ground water petroleum remediation systems.
- Allen County On-site Discharging Systems.
- Coal mines.
- Temporary Dischargers.

IDEM is currently in the process of changing its approach to general permits from permit-by-rule to administrative general permits. The first five permits listed above were converted/issued in November 2015 and are currently in the process of being renewed. The general permits for Allen County On-site Discharging Systems and for coal mines are still in progress with target issuance dates of 2020 and 2021, respectively. IDEM will issue a new general permit for Temporary Discharges in 2020.

There are currently 1,176 active individual NPDES permits, 196 pretreatment permits, and 240 facilities covered by general permits. The Permits Branch also reviews and approves long-term control plans (LTCPs) submitted by communities to reduce their discharges from combined sewers. All of Indiana's combined sewer overflow communities are under an enforceable mechanism. These mechanisms are in place to ensure implementation of approved LTCPs and/or to develop and implement an approvable LTCP. To date, 55 of Indiana's 109 CSO communities have fully implemented their CSO LTCPs.

NPDES Wastewater Compliance Program

The Compliance Branch works closely with the Permits Branch and staff members from IDEM's OWQ Enforcement Section to ensure that permit limits adequately protect designated uses and dischargers remain in compliance with their permit requirements. For example, when IDEM identifies unpermitted discharges or finds NPDES permit holders to be in violation of permit limitations or conditions, Compliance Program staff members may refer them to the Enforcement Section for appropriate action. Other Compliance Branch responsibilities include:

- Conducting routine inspections of wastewater treatment plants to evaluate NPDES compliance, as well as complaint investigations.
- Evaluation of compliance data, including data quality assurance.
- Conducting informal enforcement actions through the issuance of noncompliance letters, and assisting in the enforcement process.
- Oversight and auditing of municipal pretreatment programs in the 47 municipalities with U.S. EPA-delegated pretreatment programs.
- Providing laboratory assistance, operator technical assistance and training.
- Administration of the Wastewater Certification and Continuing Education Program.
- Recording a wide range of NPDES permit and compliance data into the Federal Integrated Compliance Information System (ICIS).
- Working in concert with other OWQ staff members in automating data flows to ICIS.
- Receiving, recording and tracking reported bypass and overflow events.
- Administration of the sewer ban and early warning program.
- Administering the laboratory proficiency program.
- Making public records available in IDEM's Virtual File Cabinet.

Stormwater Program

Stormwater run-off from urban, industrial, and rural areas contributes to water pollution in Indiana. IDEM's Stormwater programs process permit applications and issue permits, conduct compliance inspections, and conduct audits for three program areas that together help mitigate the impacts of stormwater to Indiana waters:

- Construction/Land Disturbance Stormwater Permitting
- Industrial Stormwater Permitting
- Municipal Separate Storm Sewer Systems (MS4)

The Stormwater Program and the Wetlands Program reside within the same section in OWQ's Surface Water Operations and Enforcement Branch, which has created valuable opportunities for cross training and coordination. As a result, stormwater staff members are now able to conduct compliance inspections related to suspected wetlands violations and to recognize and document violations while inspecting a site.

IDEM uses general permits to regulate most of the activities that discharge stormwater in Indiana. The general permit requirements are contained in Indiana Administrative Code and set by Indiana's Environmental Rules Board through its formal rulemaking process.

Unlike individual permits that IDEM issues to individual permittees when needed, general permits apply universally to all entities required to operate in accordance with the rule. However, IDEM is currently in the process of changing its approach to general permits from permit-by-rule to administrative general permits. IDEM is working to finalize the construction site run-off and MS4 administrative general permits and anticipates issuing them in 2020. IDEM is also developing an administrative general permit for industrial stormwater runoff. However, a timeline for its issuance has not been set.

Construction Site Run-off

Any activity that results in the disturbance of one acre or more of land requires a permit in accordance with 327 IAC 15-5 (commonly known as "Rule 5"). This general permit is intended to reduce pollutant runoff and sedimentation that can result from soil erosion. The permit also covers other activities associated with the construction projects including, concrete washout and fueling. IDEM regulates most construction projects in Indiana through the construction site run-off general permit.

Industrial Stormwater

IDEM manages industrial stormwater through a general permit developed in accordance with 327 IAC 15-6 (commonly known as "Rule 6"). General permit coverageis required for certain categories of industrial activities that are exposed to stormwater and where the runoff is discharged through a point source. The industrial stormwater general permit defines at least 32 categories of industrial activities, which can be found online at www.in.gov/idem/Stormwater/2384.htm.

The industrial stormwater general permit covers most industrial activities in Indiana. However, under certain circumstances, an industrial facility may require an individual stormwater permit. Individual permits are typically required only if a regulated industrial activity category has established effluent limitations under IDEM's NPDES Program or if IDEM determines the stormwater discharge will significantly lower water quality. Industrial facilities may also request or be required to obtain an individual permit that covers both stormwater and wastewater. The Industrial Permits Section issues these permits .

Municipal Separate Storm Sewer Systems

IDEM requires municipal separate storm sewer systems (MS4s) to develop and implement a local stormwater management plan under 327 IAC 15-13 (commonly known as "Rule 13"). During the first phase of its implementation, the federal MS4 rule designated cities (and certain counties) with a population of 100,000 or more as Phase I MS4s. Indianapolis, as the first Phase 1 MS4, has an individual stormwater permit specifically written to address stormwater quality and management. Due to population growth, Fort Wayne and Evansville have also been designated as Phase 1 communities and will be receiving individual permits within the next two years.

Federal Phase II MS4 rules came into effect in 1999 for small, urbanized areas such as cities, towns, universities, colleges, correctional facilities, hospitals, conservancy districts, homeowner's associations and military bases located within urbanized areas. Indiana currently has 186 MS4 permittees implementing Stormwater Quality Management Plans under a general permit. Under the general permit, these MS4s are required to develop a Stormwater Quality Management Plan that addresses six minimum control measures:

- Public education.
- Public involvement.
- Illicit discharged detection and elimination.
- Construction site run-off.
- Post-construction run-off.
- "Good housekeeping" for MS4 owned and operated facilities.

In addition to their regulatory role, IDEM's stormwater staff members provide education and training to the regulated community including local MS4s. Training not only includes education on the rules and regulations, but also technical training related to planning principles, stormwater plan development and review, stormwater quality/quantity measure design and implementation, and monitoring. The program also maintains a technical manual that specifically targets project site planning, construction site stormwater measures, and post-construction measures. *The Indiana Stormwater Quality Manual* is available online at www.in.gov/idem/Stormwater/2363.htm.

Wetlands Program

IDEM regulates the placement of fill materials, excavation (in certain cases) and mechanical clearing of wetlands and other waterbodies through its CWA Section 401 Water Quality Certification (WQC) program and Indiana's State Isolated Wetlands law (Indiana Code (IC)13-18-22), which covers wetlands that are not under federal jurisdiction. IDEM's regulatory authority comes from the federal CWA, a combination of state law and administrative rules for state-regulated wetlands, and from Indiana's water quality standards. IDEM regulates some activities in waterbodies in conjunction with the U.S. Army Corps of Engineers (USACE).

Anyone who wants to place fill materials, use heavy equipment to excavate or dredge, or mechanically clear areas within a jurisdictional wetland, lake, river or stream must obtain a CWA Section 404 permit from the USACE. If the USACE determines a permit is required, the property owner or representative must also obtain a CWA Section 401 WQC from IDEM. Placement of fill into non-jurisdictional wetlands, as determined by the USACE is regulated by Indiana law (IC 13-18-22 and 327 IAC 17).

Currently, if the USACE has determined a Section 404 permit is required for a project, under CWA Section 401, IDEM reviews the proposed activity to determine if it will comply with Indiana's WQS. The applicant may be required to avoid impacts, minimize impacts, or mitigate for impacts to wetlands and other waters. IDEM may deny the WQC if the activity will cause unmitigated adverse impacts to water quality, the application is deficient, the wetland activities are not necessary, or compensatory mitigation is insufficient . A regulated project may not proceed until it has received a certification from IDEM. A key goal of the program is to ensure that all activities regulated by IDEM meet the national no-net-loss of wetlands policy.

Assumption of the Clean Water Act Section 404 Permit Program

In 2017, IDEM began investigating the resources and different authorities it would need to transfer authority for the federal CWA Section 404 program from the USACE to IDEM under the rules provided for state assumption of the program in CWA Section 404(g). IDEM continues to work on the concept of

assumption among other program efficiencies, collaborating with its state and federal partners – the Indiana Department of Natural Resources (IDNR), the U.S. Fish and Wildlife Service (USFWS), U.S. EPA, and the USACE.

IDEM's Wetland Protection Activities

Wetlands occur in and provide benefits to every county in Indiana. The lack of quantitative information on some aspects of Indiana's wetland resources is an obstacle to improving wetland conservation efforts. The most extensive database of wetland resources in Indiana is the National Wetlands Inventory (NWI) developed by the USFWS. The original NWI maps were produced primarily from interpretation of high-altitude color infrared aerial photographs taken of Indiana during spring and fall 1980-1987. These maps were updated at a much higher resolution during 2008-2009 through a grant to Ducks Unlimited. The updated maps indicate wetlands extent and type, based on the Cowardin, *et al*. classification scheme (Cowardin 1979). The project also included an analysis of the state's wetlands compared with 1986 conditions, which indicated that Indiana has experienced a net loss in:

- The number of emergent, forested, shore, and scrub-shrub wetlands.
- The extent (acres) of forested, scrub-shrub, and shore wetland sub-types.

Currently, IDEM's Wetlands Program uses the updated, higher resolution NWI inventory primarily as a screening tool when evaluating applications for impacts to wetlands and streams as well as to help identify wetland compensatory mitigation or restoration sites. It has also helped IDEM staff set priorities for complaint investigations.

In addition to reviewing applications and issuing Section 401 WQCs and state-regulated wetland permits, IDEM's Wetlands Program conducts inspections to ensure compliance with the certification or permit, including any mitigation required for the project. Section 401 WQC Program staff also conduct outreach events at various locations to promote the importance of wetlands and to educate the public on regulations related to protecting wetlands. The program also works on additional projects devoted to wetland assessment and wetland protection:

- IDEM maintains a web page devoted to wetlands and water quality issues at www.in.gov/idem/wetlands/index.htm. This page includes information on the status of Indiana's wetlands, current laws and rules, conservation programs and links to other regulatory and non-regulatory wetland programs.
- IDEM maintains a web-based mapping tool for potential wetland restoration sites, including opportunities for compensatory mitigation and non-regulatory purposes at www.in.gov/idem/wetlands/pages/mitigation/

Wetlands Program Plan

U.S. EPA provided funding for IDEM to develop the Indiana Wetlands Program Plan (IWPP) to describe the goals and objectives Indiana wants to achieve related to its wetland resources. IDEM developed the IWPP voluntarily. The IWPP does not represent any new federal regulation, nor does it represent any rulemaking or new regulation on the part of IDEM. Rather it serves to establish priorities and future development of IDEM's Wetlands Program.

IDEM was the lead agency in the development of the IWPP,but worked with multiple state and federal partners including, Indiana State Department of Agriculture (ISDA) and IDNR, USACE, USFWS, United State Geological Survey (USGS), U.S. EPA, and the National Resources Conservation Service (NRCS) to gather their input and that of hundreds of stakeholders. The full plan is available online at www.in.gov/idem/wetlands/files/program_plan.pdf.

Total Maximum Daily Load Program

IDEM's Total Maximum Daily Load (TMDL) Program works with IDEM's Nonpoint Source (NPS) Program and stakeholders in watersheds with impaired waters to conduct TMDL evaluations and develop TMDL reports. A TMDL evaluation is a process that quantifies the amount of a specific pollutant that a waterbody can assimilate and still meet WQS. CWA Section 502(6) describes what constitutes a pollutant and includes materials such as sewage, chemical wastes, biological materials, and wastes from industrial, municipal, and agricultural operations in its definition. The definition also encompasses drinking water contaminants regulated under Section 1412 of the Safe Drinking Water Act (SDWA). A TMDL report is a written, quantitative assessment that accomplishes the following:

- Identifies how much of the pollutant is coming from point sources and nonpoint sources.
- Specifies the amount of pollutant reduction necessary from each source in order to meet the WQS set for that pollutant.
- Lays the groundwork for developing and implementing a plan to reduce the amount of the pollutant coming from each source.

As of June 25, 2020, the Total Maximum Daily Load (TMDL) program has developed 2,994 TMDLs for impairments to 2,631 streams and stream reaches, all of which have been approved by U.S. EPA (Appendix D). Appendix D provides an accounting of all TMDLs approved to date. TMDLs completed prior to 2014 focused primarily on *E. coli* impairments. More recently, however, IDEM has been developing TMDLs for other issues related to NPS pollution such as impaired biotic communities and nutrient impairments.

In 2013, the U.S. EPA announced its long term vision to improve implementation of the CWA 303(d) Program through a new framework for managing program responsibilities. In order to achieve the goals of its vision, U.S. EPA required states to develop a new framework for prioritizing impaired waters for TMDL development.

In 2015, IDEM developed its TMDL Program Priority Framework, which describes IDEM's methods for prioritizing waters for TMDL planning and watershed restoration. IDEM's TMDL Program Priority Framework and its Priority Ranking, which identifies the watersheds in which IDEM's TMDL development will focus its efforts now through 2022 is provided in Appendix E. IDEM submitted both to the U.S. EPA on July 8, 2015, which were reviewed and approved on September 16, 2015. IDEM revised the Priority Ranking in Appendix E to reflect its short-term TMDL development schedule, which identifies the watersheds in which TMDL development is planned for the 2022 integrated reporting cycle.

The specific waterbodies identified on IDEM's original Priority Ranking may change based on unanticipated circumstances. Although the specific waterbodies may change, IDEM will continue to follow the methods described in its Program Priority Framework when prioritizing impaired waters for TMDL development to ensure ongoing consistency with U.S. EPA's long term vision.

Nonpoint Source Pollution Program

Several agencies and organizations work together to address NPS pollution in Indiana in many ways. IDEM's Watershed Planning and Restoration (WPR) Section leads the agency's efforts to reduce nonpoint source pollution in Indiana waters in partnership with other agencies and organizations

including the Indiana Association of Soil and Water Conservation Districts (IASWCD), ISDA, IDNR. NRCS, and the Indiana Finance Authority State Revolving Fund (SRF) Loan Program. The WPR Section also leads efforts to restore waters of the state that are identified on the 303(d) List of Impaired Waters through its NPS Program, which provides grant funding and other types of assistance to support locally-led watershed planning and restoration efforts.

IDEM's NPS Program provides the funding for much of this work, which comes from two federal pass-through grant programs aimed at improving water quality in the state, Section 205(j) grants and Section 319(h) grants, both named after the authorizing section of the CWA.

Section 205(j) Grants

The Section 205(j) Grant Program is dedicated to water quality management planning. This funding helps local organizations to determine the nature, extent, and causes of point and nonpoint source pollution problems in their watersheds and to develop plans to solve these problems. In federal fiscal year (FFY) 2018-2019, U.S. EPA allocated $695,516 in 205(j) funds to Indiana. The NPS Program in turn allocated these funds to support the development of watershed management plans for the Lower Kankakee and Flatrock-Auglaize watersheds, which will provide a strong foundation for future watershed restoration efforts.

IDEM also granted 205(j) funds to the USGS to install two streamgages in the St. Marys River watershed, which will help to determine the impact of nonpoint source actions on the St. Marys River. IDEM allocated additional 205(j) funds to the USGS to operate and maintain a continuous water-quality monitoring gage on the Kankakee River for the purposes of developing mathematical surrogates for continuous suspended sediment, total nitrogen, and total phosphorus concentrations in the river. The Ohio River Valley Water Sanitation Commission (ORSANCO) also received funding to assist with monitoring for harmful algal blooms on the Ohio River upstream of Indiana's drinking water intakes on the Ohio River.

Section 319(h) Grants

The Section 319(h) Program is one of the primary funding resources for reducing NPS pollution in Indiana. The majority of these funds are used to support the development and implementation of watershed management plans (WMPs). Developing and implementing a comprehensive watershed management plan is an effective way to focus efforts and resources on a watershed and its particular problems and to implement solutions to those problems. In the planning process the watershed group identifies the problems, causes, sources, and critical or target areas in the watershed, then sets goals and chooses measures or best management practices (BMPs) to be implemented to achieve those goals. WMPs now under development must meet the required elements of IDEM's 2009 Watershed Management Plan Checklist before CWA Section 319(h) funds may be used for their implementation. The checklist incorporates EPA's nine required components of a watershed-based plan and provides comprehensive guidance on IDEM's Nonpoint Source Program expectations, as well as examples and direction on how to meet those expectations. More information about IDEM's 2009 Watershed Management Plan Checklist and a description of the U.S. EPA's nine required elements can be found online at www.in.gov/idem/nps/3429.htm.

Indiana's 319(h) Grant Program receives a significantly larger allocation than that under Section 205(j) of the CWA (Table 3, Appendix A). In federal fiscal years (FFYs) 2018 and 2019, U.S. EPA allocated $7,092,000 in Section 319(h) funds to Indiana, which IDEM used to fund 17 projects. Many of these projects are described online at www.in.gov/idem/nps/2947.htm.

Several eligible organizations submit grant proposals for 319(h) funding each year. IDEM convenes an internal review committee comprised of OWQ staff members to select projects for funding based on

the NPS Program's priorities and the quality of the proposal. Much of this funding goes to groups working to develop and/or implement a comprehensive watershed management plan that will lead to implementation of on-the-ground BMPs in critical areas of the watershed.

Many of the projects funded with NPS Program grants include the collection of water quality data for watershed planning and other purposes. In accordance with their grant agreements, these projects must develop a quality assurance project plan (QAPP) to ensure the data they collect will be reliable for their project needs. Once the NPS program's quality assurance officer approves the QAPP, grantees may begin sampling and submitting their data on customized templates designed to facilitate upload of their data into IDEM's Assessment Information Management System (AIMS) database. IDEM has upgraded and continually maintains its AIMS database to make NPS Program data more readily available for internal and external use. Additional information about IDEM's 205(j) and 319(h) grant programs and their different requirements is available online at www.in.gov/idem/nps/.

Watershed Specialists

In addition to providing grant funding, the NPS Program employs six watershed specialists who provide an important link between watershed groups and other interested stakeholders and OWQ programs. In 2018 and 2019, the watershed specialists assisted nearly 149 watershed groups with many tasks including:

- Meeting facilitation.
- Reviewing draft and final watershed management plans.
- Reviewing grant proposals.
- Providing water quality data and watershed maps.
- Connecting them with other local organizations and agencies to complement planning efforts.
- Assisting watershed coordinators with the overall watershed planning and implementation processes.

The watershed specialists also work with the TMDL Program by attending TMDL public meetings to provide information on watershed planning and to build local partnerships to address water quality.

Nonpoint Source Program Priorities

IDEM's NPS Program is built upon the foundation provided by *the Indiana State NPS Management Plan*, which is required by Section 319(b) of the CWA. This plan is a strategic document developed by IDEM and approved by U.S. EPA, which identifies tactical priorities, goals, and milestones to address NPS problems in Indiana more effectively. The plan also provides the basis for funding decisions and programmatic direction for the state program and its partners. The current plan, which was developed in 2019, is available online at www.in.gov/idem/nps/3036.htm. U.S. EPA requires states to update their NPS management plans every five years. The next revision of IDEM's NPS Management Plan will be due in 2023.

Each year, IDEM identifies priority projects for Section 319(h) funds consistent with the goals in the *Indiana State NPS Management Plan* in order to more efficiently meet NPS Program goals, coordinate with TMDL Program efforts to identify and reduce NPS pollution, and focus more funding on impaired waters. For FFYs 2017 through 2019, the NPS Program has focused funding on the following four priorities:

1. Develop a WMP or implement an IDEM approved WMP that will reduce nutrient loads within the following 8-digit Hydrologic Unit Code (HUC) watersheds identified as priorities in Indiana's State Nutrient Reduction Strategy. IDEM and ISDA collaborated on the development of this strategy, which is available online at www.in.gov/isda/2991.htm, to help meet the State NPS Management Plan goal to utilize partnerships to leverage available resources for more effective management of nonpoint source pollution. The following watersheds have been identified in the strategy as priorities for planning and implementation of BMPs to reduce nutrient loadings to lakes and streams:

    - Upper Wabash (05120101).
    - Middle Wabash-Deer (05120105).
    - Middle Wabash-Little Vermillion (05120108).
    - Middle Wabash Busseron (05120111).
    - Lower Wabash (05120113).
    - Upper White (05120201).
    - Lower White (05120202).
    - Maumee River (04100003, 04100005, 04100007, 04100004).

2. Develop a WMP or implement an IDEM-approved WMP that includes a 10-digit HUC watershed with a surface water drinking water intake and one or more waters identified in Category 5A of the Draft 2014 303(d) List of Impaired Waters. IDEM anticipates that this priority will help meet the State NPS Management Plan goal to protect sensitive, vulnerable, and high quality waters of the state so that they may continue to meet their designated uses. The FFY 2019 Solicitation Priority Watersheds map, which is available on the NPS Program web page at: www.in.gov/idem/nps/3363.htm, reflects this priority.

3. Develop a WMP or implement an IDEM approved WMP that includes a 10-digit HUC watershed that impacts outstanding state resource waters and/or waters with endangered, threatened, or rare species. IDEM envisions that this priority, too, will help meet the goal of protecting sensitive, vulnerable, and high quality waters of the state so that they may continue to meet their designated uses. The FFY 2019 Solicitation Priority Watersheds map likewise reflects this priority.

4. Implement a WMP that meets the IDEM 2009 Watershed Management Plan Checklist. As noted earlier in this report, while IDEM now requires all WMPs now under development to meet the required elements of IDEM's 2009 Watershed Management Plan Checklist in order to receive additional 319(h) funding for implementation, most plans developed prior to 2009 do not meet these requirements. However, IDEM may still award funding to groups with older plans on a case-by-case basis, depending on the level of the detail in the original plan. To assist groups with older plans to become more competitive for implementation grants, the NPS Program offers guidance online to help them determine if they need to either revise or totally rewrite their plans: www.in.gov/idem/nps/3454.htm. The program's watershed specialists also provide assistance.

The NPS Program regularly assesses the success of its program in different ways. One important measure of the program's success is the quantity of pollutants, such as sediment, phosphorus, nitrogen,

and *E. coli* that NPS-funded projects are preventing from entering Indiana waters resulting from the implementation of best management practices (BMPs). Most NPS program projects in Indiana use the U.S. EPA Load Estimation Model to estimate the pollutant load reductions for each BMP they implement and provide their results to IDEM as part of their grant agreement. Table 4 (Appendix A) shows the total reported estimated pollutant load reductions in Indiana for FFY 2018 and 2019.

Another program measure (commonly referred to as "WQ-10" or "success stories") tracks the number of waterbodies identified by states as being primarily NPS-impaired that have been partially or fully restored as a result of restoration efforts (Table 5, Appendix A). Later sections of this report will discuss Indiana's FFY 2018 and 2019 Success Stories in more detail.

Volunteer Monitoring Programs

Hoosier Riverwatch

Hoosier Riverwatch (HRW) is a statewide volunteer stream water quality monitoring program with the mission to involve the citizens of Indiana in becoming active stewards of Indiana's water resources. HRW accomplishes this through watershed education, water monitoring, and clean-up activities.

HRW educates citizen volunteers on a variety of watershed and pollution issues and provides them with training and equipment to conduct water quality monitoring. In the last 10-15 years, HRW has trained more than 4,200 citizens in and around Indiana through about 350 full-day workshops. Many of those trained are parents, teachers, and scout leaders who, in turn, have taught and inspired countless youth about water quality and the impacts humans can have on water resources.

HRW also maintains an online database that allows volunteers to enter their own data and view data collected by other volunteers. Volunteers are encouraged to enter their results into the database to make them available to other interested parties such as watershed groups, schools, and IDEM staff members for potential use in various OWQ programs. In addition to basic search functions, the visualization tools of the database allow volunteers to view their data and that collected by others in comparison with state and watershed averages through simple graphics. About one out of every three persons trained in HRW workshops enter the data they collect into the online database.

IDEM's Watershed Assessment and Planning Branch administers the HRW Program. This allows for better coordination with IDEM's Nonpoint Source (NPS) Program, whose grantees commonly use HRW methods to meet the monitoring and outreach components of their funded projects and encourages greater data sharing through IDEM OWQ's External Data Framework (EDF). The HRW and NPS Program are also exploring different ways that volunteer monitoring can become more fully involved in watershed planning and restoration efforts as a whole.

HRW volunteers also have opportunities to interact with their professional counterparts within IDEM OWQ. HRW staff members have worked with OWQ biologists and others to offer training to the program's corps of volunteer instructors in various topics. In 2019, training opportunities with IDEM OWQ included advanced *E. coli* workshops, advanced macroinvertebrate sample collection and processing, and a look at interactive tools and games for use during workshops when weather or water levels keep participants indoors.

More information about Indiana's HRW program can be found online at http://www.in.gov/idem/riverwatch/index.htm.

Clean Lakes Volunteer Monitoring Program

The Indiana University O'Neill School of Public and Environmental Affairs has been working with IDEM's NPS Program since 1989 to administer the Indiana Clean Lakes Program (CLP) with funding provided through CWA Section 319(h). The Indiana CLP provides a comprehensive, statewide public monitoring program for lakes that includes public information and education, technical assistance, citizen science volunteer lake monitoring, and water quality assessment of Indiana lakes.

Indiana has more than 1,500 lakes, reservoirs, and ponds – many of which are under pressure from human activities such as poorly managed agriculture, suburbanization of lakeshores, boating impacts, and septic system discharges. These activities can result in excessive nutrient concentrations reaching lakes, which can lead to accelerated eutrophication and related undesirable effects including nuisance algae, excessive plant growth, murky water, odor, and fish kills. The Indiana CLP, coordinated by O'Neill School staff members and students, includes the following components:

- Annual professional sampling of lakes and reservoirs.
- Training and support of a corps of citizen scientist as volunteer lake monitors.
- Maintenance of the Indiana CLP website.
- Technical assistance and expertise on lake-related issues.

The CLP also works to develop educational materials such as brochures and fact sheets and conducts education and outreach through its biannual newsletter and participation in the Indiana Lakes Management Society Conference each year. The program holds workshops each year to help increase public understanding of the important zones of a lake that provide essential habitat and ecosystem services. Volunteers that participate in the workshops often expand their monitoring efforts becoming even better lake stewards. This program is very popular volunteers, and continues to improve with each workshop. In 2012, the program expanded its volunteer monitoring program to include aquatic invasive species monitoring with the goal of improving early detection and prevention of the spread of invasive species and added zebra mussels in 2014.

Volunteers enter the data they collect on the CLP website at: https://clp.indiana.edu/. Volunteer data reports are available on the website for the years 1999-2019. Information regarding IDEM's use of the data collected by IU-SPEA staff members and students for CWA Section 305(b) and Section 314 assessments can be found in a later section of this report.

COORDINATION AND COLLABORATION WITH OTHER AGENCIES AND ORGANIZATIONS

Nonpoint source (NPS) pollution ranges from urban sources to construction and agricultural run-off making cooperation across political boundaries and disciplines essential. Many local, regional, state, and federal agencies play an important role in addressing NPS pollution, especially at the watershed level. Various agencies in Indiana provide data, technical resources and grants to local watershed groups to assist with planning, infrastructure design review and implementation of BMPs to reduce and prevent NPS pollution. Through coordination and collaboration, the IDEM and other agencies more effectively focus water quality restoration and protection efforts where most needed.

This report describes how IDEM's OWQ works in partnership with individual agencies and organizations on some efforts and in collaboration with multiple agencies to more effectively address Indiana's water resource issues. IDEM employs six watershed specialists that act as liaisons for local, state and federal entities to integrate watershed planning into local level planning efforts. These specialists serve as Section 319(h) project managers assisting in a technical, managerial and financial advisory role for local watershed groups.

IDEM's Wetlands and Stormwater Program staff work cooperatively the following several agencies and other organizations to provide technical assistance and issue Clean Water Act (CWA) 401 water quality certifications, state permits for isolated wetlands, and construction/land disturbance permits to protect water quality:

- U.S. Army Corps of Engineers (USACE)
- Indiana Department of Natural Resources (IDNR)
- U.S. Fish and Wildlife Service (USFWS)
- Local soil and water conservation districts (SWCDs)

Indiana Department of Natural Resources

Division of Reclamation, Abandoned Mine Lands Program

IDEM's TMDL and NPS Programs work with IDNR's Abandoned Mine Lands (AML) Program on TMDL development and potential water quality improvements in watersheds with abandoned coal mines. The AML Program contributes to these efforts by sharing water quality data and information regarding the costs and techniques involved in their reclamation projects. The AML Program has also helped to educate OWQ staff members about areas impacted by acid mine drainage by touring reclamation projects with them at different points in the reclamation process.

Division of Land Acquisition, Indiana Stream and Wetland Mitigation Program

The Indiana Stream and Wetland Mitigation Program (IN SWMP) is a statewide in-lieu fee program that allows permit applicants the option to purchase stream and/or wetland mitigation credits to fulfill compensatory mitigation requirements associated with a Section 404 permit from the USACE, a 401 Water Quality Certification, and/or an Isolated Wetland Permit from IDEM. Permittee applicants may purchase these credits in-lieu of performing mitigation themselves. The IDNR received final approval of their Final Instrument to sponsor an in-lieu fee stream and wetland mitigation program from the USACE and the Interagency Review Team on May 3, 2018. The program must follow the requirements laid out in the federal mitigation rule (33 Code of Federal Regulations (CFR) Section 332.8) for administration and operation of the program. IDNR's in-lieu fee program will utilize data and information when available and applicable from IDEM's Office of Water Quality, Watershed Assessment and Planning Branch, IDNR's Lake and River Enhancement program (LARE), and local watershed and/or conservation plans to assist with the prioritization of potential stream and restoration projects involving wetland mitigation.

Division of Fish and Wildlife, Lake and River Enhancement Program

The goal of the LARE Program in the IDNR Division of Fish and Wildlife is to reduce the amount of sediment and nutrients entering Indiana's lakes and rivers. Coincidental to this goal is an ongoing effort to utilize LARE-funded projects to protect and enhance aquatic habitat for fish and wildlife to ensure the continued viability of Indiana's publicly accessible lakes and streams for multiple uses, including recreation.

The LARE Program accomplishes these goals through state grants to eligible sponsoring entities to provide for technical and financial assistance to qualifying projects. These projects range from diagnostic studies of targeted sub-watersheds to determine the design and construction feasibility of measures to reduce erosion and sedimentation in lakes and streams. Indiana law dedicates a portion of LARE funding to the removal of sediment, logjams and other obstructions, and control of invasive aquatic species. The program also provides funding to county SWCDs to assist individual landowners in the use of BMPs in targeted watersheds.

In 2019, LARE grants totaled more than $2.3 million to projects in several counties across the state. Funding for the program comes from a fee paid by boat owners annually to the Bureau of Motor Vehicles. LARE projects leverage these funds to benefit not just boaters but everyone who uses Indiana's publicly accessible lakes and streams. LARE-funded projects also help to improve aquatic habitat and reduce the amount of nutrients entering both the Great Lakes and the Mississippi River through Indiana streams.

Lake Michigan Coastal Program

The purpose of the IDNR's Lake Michigan Coastal Program (LMCP) is to enhance the state's role in planning for and managing natural and cultural resources in the coastal region and to support partnerships between federal, state and local agencies and other organizations. The LMCP annually awards grants through its Coastal Grants Program funded by the federal Coastal Zone Management Act to coastal municipalities, counties, nonprofit groups, and universities for projects that protect and restore natural, cultural and historic resources in Indiana's Lake Michigan coastal region. Examples of how these funds might be used include:

- Protection and restoration of significant natural and cultural resources.
- Programs to prevent the loss of life and property in coastal hazard areas.
- Improved public access for recreational purposes.
- Revitalized urban waterfronts and ports.
- Improved coordination among government agencies when making policy decisions.
- Pollution prevention initiatives, including NPS pollution into coastal waters.

During 2018-2019, the Lake Michigan Coastal Program awarded $114,440.00 in pass-through grants to communities, non-profit organizations, universities and schools specifically for water quality planning, outreach/education, research and improvement projects across the Lake Michigan Watershed.

Section 6217 of the Coastal Zone Act Reauthorization Amendments, which is jointly administered by the National Oceanic and Atmospheric Administration (NOAA) and U.S. EPA, established Indiana's Coastal NPS Pollution Control Program in 1990. The program is part of Indiana's LMCP and received conditional U.S. EPA/NOAA approval in 2008, establishing a set of management measures to help states control and reduce polluted runoff to coastal waters from five main sources:

- Agriculture. In 1990,
- Urban areas.
- Marinas and recreational boating.
- Hydromodification, including shoreline and stream channel modification.
- Wetlands, riparian areas, and vegetated treatment systems.

All coastal and Great Lakes states and territories that participate in the National Coastal Zone Management Program are required to develop nonpoint source pollution control programs for their coastal regions. State authorities ensure implementation.

The LMCP is working closely with IDEM's NPS Program and other NPS program partners to implement management measures specified by U.S. EPA to prevent and mitigate NPS pollution in the Lake Michigan coastal watersheds. IDEM anticipates submitting documentation indicating that Indiana now meets all remaining Coastal NPS Pollution Control Program conditions to U.S. EPA/NOAA on or before May 31, 2020.

Of the 56 measures that Indiana's Coastal NPS Pollution Control Program was required to implement, only one remains to be developed. This measure requires putting processes in place across the coastal watershed to ensure regular inspection and maintenance of septic systems to minimize pollution from failing systems. In 2017, IDEM's NPS Program awarded the Lake Michigan Coastal Program a

Section 319(h) grant to help it move toward approval of this final measure. This grant involves three components:

1. Mapping septic systems within 500 feet of surface waters within Indiana's Lake Michigan Watershed.
2. E. coli monitoring and molecular source tracking to develop a better understanding of the impact of septic system pollution on surface waters.
3. A robust neighborhood-based outreach and education program targeted at homeowners in partnership with neighborhood ambassadors and realtors.

The LMCP completed mapping septic systems in early 2019 through a partnership with the Northwestern Indiana Regional Planning Commission. The mapping included identification of target neighborhoods for the neighborhood outreach campaign. The program also completed its neighborhood-based outreach and education task in 2019, with signage and materials distributed by Neighborhood Ambassadors. In 2018 and 2019, the Governor issued a proclamation designating SepticSmart Week in the State of Indiana, and the LMCP created a comprehensive web-based outreach campaign with a social media component, with resources available online: https://www.in.gov/dnr/lakemich/10025.htm.

In 2019, the LMCP submitted an additional IDEM Section 319 grant application for funding to continue its work with county health departments on building capacity for septic system inspection and maintenance tracking should ordinances be developed that require inspections and maintenance at point of sale.

Indiana's Low Head Dam Removal Initiative

Low-head dams have a long and diverse history in Indiana . A low-head dam is defined as a man-made obstruction typically built within a river or stream channel and spanning from bank to bank (IDNR 2019). Thousands of low-head dams exist in many variations on streams and rivers throughout the United States. But, they generally have water flowing across the entire length of the top of the dam, are from one to about 15 feet tall (although taller ones exist on very large streams), store a minimal amount of water below the stream bank level, within the channel, and do not typically provide flood reduction storage. Most were built during the latter 19th and early 20th centuries to provide water to power grain mills, water retention for drinking water, water diversion for the cooling water intake structures for electrical generating stations, navigation, and so on. The IDNR has cataloged more than 150 low-head dams across Indiana. Many low-head dams are aged, require expensive repair or maintenance, and no longer serve their original purpose.

Low-head dams result in hydrologic alteration of streams and rivers that impedes the natural flow regime necessary to maintain a healthy aquatic biota. Ecologically, low-head dams inhibit the movement and migration of aquatic fauna, particularly fish. This inhibited movement has a direct impact on the movement and distribution of Unionid mussels in Indiana streams because of their dependence on the fish community. Low-head dams may be responsible in part for the long-term decline of Unionid mussel distributions and diversity in Indiana. They have interrupted riverine connectivity, altered hydrologic regimes, caused adjacent flooding, altered natural habitats, and altered the flow and transport of sediments, which is important for the natural replenishment of downstream ecosystems.

Low-head dams are also deceptively dangerous, especially from upstream. Under certain flow conditions, low-head dams may create recirculating currents and hydraulic forces on the downstream side of the dam, which pose hazards to recreational boaters, swimmers and anglers by swamping boats and trapping and drowning victims. Indiana ranks 10th in the nation for the highest number of fatalities at low-head dams. In 2017 alone, Indiana recorded deaths on the West Fork White River, Eel River, and Big Walnut Creek.

Removal of low-head dams restores natural river ecology, re-establishes river continuity and maintains public safety. However, removal of these structures is costly, complicated, and requires review and permitting by state and federal agencies. The process for permitting requirements among the various agencies often created confusion for applicants in early Indiana dam removal projects.

In order to clarify and streamline the low-head dam removal process for applicants, IDEM OWQ and the Office of Land Quality collaborated with the IDNR to establish a joint guidance document to promote removal of these structures and to aid sponsors in the permitting process. IDEM and IDNR have also created an online map so staff can identify possible "red flag" components that may complicate the dam removal, such as potentially contaminated sediment, invasive species, or historical significance, so that information can be communicated to applicants.

This initiative developed a process for early coordination clarifying what information will be required for permits. As a result, IDEM and IDNR have been able to review and process applications for removal faster than earlier applications. To date, approximately 350 river miles have been opened up on four major streams through the removal of 12 low-head dams and two modifications, including the construction of one fish passageway. One stream where low-head dams were removed has been successfully restocked with state and federally endangered Unionid mussels, and another will extend the habitat for state endangered Eastern Hellbenders. Four additional low-head dams either are in the permitting process or proposed for removal in the future. Removal of these additional low-head dams would open up approximately 411 additional river miles.

Indiana Conservation Partnership

IDEM is a member of the Indiana Conservation Partnership (ICP) – a partnership comprised of eight state and federal agencies and other organizations committed to the goal of promoting conservation. The ICP provides technical, financial, and educational assistance needed to implement conservation practices that are environmentally and economically compatible and promote good stewardship of Indiana's soil and water resources. IDEM serves on the ICP with the following agencies and organizations:

- U.S. Department of Agriculture Natural Resources Conservation Service (USDA-NRCS).
- U.S. Department of Agriculture Farm Service Agency (USDA-FSA).
- State Soil Conservation Board.
- Indiana State Department of Agriculture (ISDA).
- Indiana Department of Natural Resources (IDNR).
- Indiana Association of Soil and Water Conservation Districts (IASWCD).
- Purdue University Extension.

The ICP prepares an annual work plan that defines objectives for up to four conservation focus areas and includes the actions, responsible entities and deadlines for achieving them. Additionally, the ICP meets bimonthly for partner updates and, where possible, to collaborate for optimizing its resources for achieving water quality objectives. The ICP places particular emphasis on delivering technical training to partner staff and coordinating the various cost-share and grant programs.

In June of 2019, the ICP updated its soil health philosophy to underscore the widely accepted definition of soil health as "the capacity of a soil to function as a vital, living ecosystem that sustains plants, animals, and humans" (Pankhurst et al., 1997). The four key soil health principles that apply to all land uses include:

- Minimize disturbance
- Maximize soil cover
- Maximize biodiversity
- Maximize continuous living roots

To be successful in fully implementing a soil health system, the following objectives must continually be part of every management decision and field operation:

- Increasing organic matter
- Increasing water infiltration
- Improving nutrient use efficiency
- Increasing aggregate stability
- Increasing water-holding capacity
- Enhancing and diversifying soil biology and habitat.

The ICP works with producers to help them implement a "systems" approach to improve the health of their soil. A system is a suite of practices and management methods that when implemented results in additional improvement to soil health that can help address Indiana's primary resource concerns.

State Nutrient Reduction Strategy

Indiana's State Nutrient Reduction Strategy, which is available online at https://www.in.gov/isda/2991.htm, provides a framework for reducing nutrients entering Indiana waters, is a collaborative effort between ISDA, the lead agency and Gulf Hypoxia Task Force member, and IDEM with contributions from other ICP partners. It is on a two-year revision or "updating" cycle and was revised in 2018. As part of this strategy, the ICP has committed to report load reductions of sediment, nitrogen, and phosphorus achieved by the practices installed under the various funding authorities of its participating agencies. ISDA technicians use the U.S. EPA Region 5 model to calculate load reductions. Cumulative load reductions for calendar years 2013-2019 follow:

- Sediment – 1,667,979 tons
- Nitrogen – 3,518,499 pounds
- Phosphorus – 1,737,256 pounds

Indiana's State Nutrient Reduction Strategy along with watershed story maps and ICP accomplishments can be found at www.in.gov/isda/2991.htm. More detailed information about the ICP and its activities can be found at http://wordpress.iaswcd.org/icp/.

U.S. Department of Agriculture, Natural Resource Conservation Service

National Water Quality Initiative

USDA annually targets Farm Bill dollars to the NRCS National Water Quality Initiative (NWQI) to promote the implementation of conservation practices. IDEM worked closely with NRCS to prioritize watersheds for the NWQI using the decision criteria of watersheds with impaired waters, high-risk natural resource areas, active local watershed groups or conservation interests, and baseline water quality data. As a partner on the NWQI, the U.S. EPA requires IDEM in its role as the state agency in Indiana charged with implementing the CWA, to contribute monitoring resources to at least one NWQI watershed.

The watershed selected for NWQI monitoring is the School Branch watershed, a small (8.4 square miles) watershed located in northeastern Hendricks County, Indiana. School Branch is nestled within the Eagle Creek watershed, which is located in the larger Upper White River Watershed. Land use in the watershed is predominately agricultural with interspersed residential areas. In the School Branch watershed, soils are predominantly poorly drained and extensively tiled to improve the drainage in many areas. School Branch eventually drains into Eagle Creek Reservoir, which is a primary drinking water source for Indianapolis.

School Branch, Eagle Creek, and the Upper White River watersheds are on Indiana's 303d List of

Impaired Waters due to high levels of nutrients. The size of the Eagle Creek and Upper White River watersheds (163 and 2,718 square miles, respectively) and the variety in land uses at these scales has made it difficult to evaluate the effects of conservation and land management strategies. Therefore, focusing on the much smaller School Branch watershed, in which 80 percent of the land use is agricultural, will allow researchers to adequately isolate water quality impacts from agriculture versus other sources. Previous attempts to document water quality improvements from agricultural conservation practices at the watershed scale have proven particularly difficult due to the number of issues that could hinder the ability to attribute improvements to specific practices. These issues include:

- Insufficient baseline data.
- Incomplete separation of agricultural influences from non-agricultural sources.
- Inadequate sampling duration and intensity to account for "lag time", seasonal influences, and storm events.
- Insufficient adoption of complete conservation systems within watersheds.

The collaboration of federal, state, local, and academic entities, along with dedicated conservation-minded farmers in the School Branch watershed, has provided a unique monitoring opportunity to assess the chemical, physical, and biological impacts of conservation practices.

Currently, the project is measuring water quality associated with conservation cropping systems that improve soil health in predominantly corn and soybean row crop agriculture. The data collected through this effort will allow evaluation of how production agriculture can complement sustainable water resources. In addition, because the School Branch watershed lies within two successively larger watersheds of similar land use and hydrology, the project is monitoring and can model impacts of conservation at multiple scales including watershed, sub-watershed, and edge-of-field. Historical data is also available to enhance the assessment of improvements over time.

Monitoring and evaluation efforts continued in 2018 and 2019. Different partners in this effort, including IDEM, the USGS, the Indiana Geological and Water Survey (IGWS), the Marion County Health Department, USDA-NRCS, and the Center for Earth and Environmental Services at Indiana University-Purdue University, Indianapolis, are conducting monitoring and evaluation at different scales and expect to publish a report in 2020 covering the first three years of data.

These agencies and organizations are conducting this monitoring to measure streamflow and ground water levels by collecting continuous water data from School Branch through three stream gauges and four ground water wells. Two studies, a synoptic study of tile drains and an isotope and major ion study were conducted to gain a better understanding of the hydrology and nutrient transport within the study area. The partners are also monitoring soils to determine their moisture levels, water-holding capacity, and nutrient content. They are also using supplementary biological indicators to evaluate factors affecting water quality and conducting nutrient source tracking to determine impacts from field, in-stream bed and bank, and residential sources and have analyzed sediment characteristics. Monitoring efforts will continue through 2021.

Thanks to conservation-minded farmers participating in this study, the research partners collaborating on this project will be better able to distinguish between the water quality effects associated with complete conservation cropping systems from other agricultural and non-agricultural sources of sediment and nutrients.

Indiana Water Monitoring Council

The Indiana Water Monitoring Council (InWMC) (http://www.inwmc.net/) is a broad-based, statewide organization whose primary mission is to enhance the communication, collaboration and coordination of professionals, organizations, and individuals monitoring, managing, protecting, and/or restoring Indiana's water resources. As a charter member, IDEM has remained actively involved with the InWMC, maintaining a presence on the board of directors and participating in committees to assist with activities that:

- Provide a forum for communication among groups involved in monitoring Indiana waters.
- Promote the sharing of monitoring data and information on effective procedures and protocols for sample collection.
- Facilitate the development of collaborative monitoring strategies.

The InWMC supports communication, collaboration, and coordination about monitoring across the full spectrum of water resources – both surface water and ground water – from multiple perspectives including water quality, water quantity, ecology, and human health.

Shortly after the InWMC's formation, its Data Optimization Committee convened the Integrated Water Monitoring Network Optimization Taskforce to work toward a better understanding of water quality monitoring efforts throughout the state.

Multiple state, federal, and local agencies and organizations monitor water quality within Indiana, each with its own mandate or reason for monitoring. Although each agency and organization is collecting potentially valuable data on Indiana's water resources, the lack of coordination can lead to duplication of efforts and overlooking of important information due to the lack of data sharing. Members of the InWMC have overwhelmingly cited the need for a shared understanding of existing, active monitoring networks within Indiana among the water resources community as being critical to effective management of water resources throughout the state.

In 2017, the InWMC published the findings of the taskforce on the InWMC website in a paper entitled, *An Assessment for Optimization of Water-Quality Monitoring in Indiana* – a study of ongoing monitoring networks throughout Indiana to help environmental managers, researchers, and interested citizens find data from sampling sites with long periods of record. The study is available at http://www.inwmc.net/resources/monitoring-network-optimization/ and highlights the existing river and stream water quality monitoring networks, including IDEM's, that can provide data and identify new sites that may be needed to augment existing networks and/or eliminate sites that are currently being monitored by more than one group.

The InWMC also publishes the annual *Indiana Water Report,* which is available at http://www.inwmc.net/resources/indiana-water-report/ and describes current water-related monitoring and research going on throughout the state. The report is intended to help those working to manage water resources in Indiana do so more effectively and with a fuller understanding of how their efforts fit into the larger picture and to support greater communication and collaboration wherever possible.

Indiana Finance Authority

The Indiana Finance Authority administers the Indiana State Revolving Fund (SRF) Loan Programs, which offers two different loan programs that provide low-interest loans to Indiana communities, one for projects that improve drinking water and the other for wastewater infrastructure projects. The purpose of these programs is to protect public health and the environment. Cities, towns, counties, regional sewer/water districts, conservancy districts are eligible to apply for either program. Private and not-for-profit public water systems and water authorities are eligible for drinking water SRF loans.

Eligible projects include those that abate water pollution problems, provide greater protection for public health or ensure compliance with either the CWA or the Safe Drinking Water Act. Wastewater projects may include wastewater treatment plant construction or improvements, sewer line extensions to existing unsewered areas, decentralized treatment systems, combined sewer overflow elimination and infiltration/inflow corrections. Drinking water projects may include treatment plant construction and improvements, water storage facilities, water distribution systems and water supply. The program provides additional financial incentives to projects to include green technology, a Brownfields program project or a sustainable infrastructure component.

Both SRF Loan Programs can offer up to a 35-year fixed rate loan term. Interest rates on these loans use a base interest rate, which resets on the first business day of each January, April, July and October. The base rate is calculated by using 90 percent of the average 20-year AAA-rated, general obligation bond Municipal Market Data composite index for the most recent calendar month. The program is able to further discount the base rate based upon a borrower's median household income from the current American Community Survey data five-year estimate and projected user rates. To encourage participants to pursue projects that further improve public and environmental health, the SRF Loan program offers four incentive programs. By integrating lead line replacement, green/sustainable infrastructure components, NPS project components, or a Brownfield project, the SRF Program may reduce the interest rate on a loan by up to 0.5 percent. The program has established a floor of two-percent for the lowest interest rate, including any reductions that a loan may receive.

The SRF Loan Programs coordinate with state and federal programs, including IDEM's OWQ, to identify additional ways in which the assistance they provide to Indiana communities might help to achieve common goals. For example, the Clean Water SRF ranking and scoring gives additional points for projects that remove a pollutant source from an impaired stream. This method of scoring increases the likelihood that projects with a water quality benefit will rank high on the SRF project priority list. The funds loaned for these removal projects can be documented as a match for projects submitting grant proposals to the NPS Program. Projects eligible for match must provide water quality benefits to their respective communities and may include, but are not limited to, one or more of the following:

- Wetland restoration/protection.
- Erosion control measures.
- Ground water remediation.
- Repair or replacement of failing septic systems or connection to sewer.
- Stormwater BMPs.
- Source water and wellhead protection.
- Conservation easements.
- Agricultural and waste management BMPs.

The SRF Loan Programs also serve on the Indiana Rural Wastewater Task Force's Environmental Infrastructure Working Group, which allows the SRF Loan Programs the opportunity to provide input and offer financing options to communities for their drinking water and/or wastewater infrastructure needs. The SRF Loan Programs work with communities addressing combined sewer overflows, enforcement issues or those with or nearing a sewer ban.

Over the State Fiscal Years (SFYs) 2018 and 2019, ten projects with a NPS component saved an additional $40,910,550 over the term of their loans. While these savings are realized over the longer term, these projects are typically completed within two years, and the water quality benefits are achieved much sooner than 20 years.

Indiana's Great Lakes Water Quality Agreement Domestic Action Plan

Indiana's Great Lakes Water Quality Agreement (GLWQA) Domestic Action Plan (DAP) to reduce phosphorous to the Western Lake Erie Basin was finalized on February 28, 2018 and emphasizes:

- Using existing programs and optimizing partnerships.
- Effecting the most change with the least cost.
- Prioritizing resources to areas with the most phosphorus export and/or reduction potential.
- Seeking to engage citizens who are not participating in conservation efforts.
- Making use of social indicators to guide actions and employing adaptive management.

Indiana's goal is to meet the springtime phosphorus targets identified in the DAP for the Maumee River as it flows across the border into Ohio. Since 2018, Indiana and Ohio have collaborated with the U.S. EPA to provide funding for the USGS to install and operate three auto-samplers on their border. To determine phosphorus loads coming into Indiana from Ohio, auto-samplers were installed on the St. Joseph River and the St. Mary's River, each of which flows into Indiana from Ohio. At their confluence, these rivers form the Maumee River that flows eastward from Indiana into Ohio. Another auto-sampler was installed on the Maumee River on the Indiana side of the border to characterize phosphorus loads going into Ohio from Indiana. The data from this monitoring network will be instrumental in guiding actions to reduce phosphorus. The DAP is available online at https://www.in.gov/isda/files/Lake%20Erie%20Domestic%20Action%20Plan%20_Final.pdf.

COST/BENEFIT ASSESSMENT

Water is a vital component of the economic health of Indiana, which is diverse in its agriculturial, industrial, and environmental resources. Creating the benefits associated with a robust economy, high quality of life, and healthy ecosystems requires finding the right balance between often-competing needs. However, the finances available to restore, enhance, and protect our water resources is limited in comparison to the work needed to ensure that balance. The following is a discussion of some of the revenue sources available to state, regional, and local entities to achieve the objectives of the CWA as well as case studies that illustrate improvements in water quality and their resulting benefits.

Funding Water Quality Improvements through Better Infrastructure

Since 1992, the State Revolving Fund (SRF) Programs have provided more than $5.7 billion dollars for more than 862 wastewater (Figure 2, Appendix B) and drinking water (Figure 3, Appendix B) infrastructure improvement projects. SRF Program assistance to communities is expected to result in water quality benefits for many Indiana rivers and streams.

In state fiscal years (SFYs) 2018 and 2019, the Wastewater SRF Program closed 62 loans totaling approximately $679 million. This provided an estimated savings (compared to open market interest rates) of more than $137 million. In SFYs 2018 and 2019, the Drinking Water SRF Program closed on 27 loans totaling over $ 214 million with savings to Indiana communities estimated at more than $42 million (Table 6, Appendix A.)

Successes in Water Quality Improvement through Strategic Measures

IDEM has reported improvements in water quality in more than 260 miles of streams in 15 different watersheds since 2007 to the U.S. EPA to meet measures outlined in U.S. EPA's strategic plan (Table 5). Measure WQ-10a is a performance measure that requires states to develop Nonpoint Source (NPS) Program "Success Stories" and submit them to U.S. EPA for the purposes of tracking how NPS restoration efforts are improving water quality. To meet this measure, IDEM must identify nonpoint source-impaired waters with improvements resulting from watershed restoration efforts undertaken in whole or in part by IDEM's NPS Program.

In 2018 and 2019, IDEM reported water quality improvements in South Fork Wildcat Creek and Boyles Ditch watersheds. U.S. EPA's Nonpoint Source Success Stories website at https://www.epa.gov/nps/nonpoint-source-success-stories-indiana highlights these and other successes in water quality restoration.

<u>Aquatic Life Use Restored in a Tributary to South Fork Wildcat Creek</u>

This unnamed tributary to the SFWC (assessment unit INB0738_T1002) is a small headwater stream in the Wildcat Creek watershed in Clinton County, Indiana (Figure 4, Appendix B). It is in the eastern portion of the highly agricultural Jenkins Ditch-SFWC watershed. Most of the land use in this watershed consists of cultivated cropland, and while the land along the main stem of the SFWC is forested, most of its headwaters have no riparian buffer. Water quality sampling performed by IDEM in 1998 revealed a low index of biotic integrity (IBI) score, indicating that the stream was unhealthy.

Various partners have implemented several projects in the greater SFWC watershed over the years (Table 7, Appendix A). In the late 1990s, the IASWCD undertook efforts to provide strategic planning and technical assistance to the larger Wildcat Creek watershed using $189,500 in CWA section 319 funding. The Wildcat Creek Watershed Alliance took over implementation of the Wildcat Creek Watershed Management Plan in 2006 using $150,000 in CWA section 319 funds.

The U.S. Department of Agriculture's Natural Resources Conservation Service provided further funding and technical assistance through a variety of programs in the Jenkins Ditch–SFWC watershed between 2004 and 2017, totaling $7,951,224. Between 2001 and 2017, the Clinton County SWCD used a variety of funding sources (including private funds and CWA section 205(j) and 319 funds) to write a nine-element plan specific to the SFWC watershed and to provide cost share on BMP installations in the watershed, at a cost of $754,628.

IDEM returned to the SFWC tributary for follow-up monitoring in 2017. This monitoring showed an improved IBI score of 46 at the mouth of the stream, which exceeds the minimum IBI of 36 needed to indicate support of a well-balanced aquatic community. The habitat showed marked improvements in reduction of silt, as well as deeper pools, less embedded riffles, and a bank that had recovered from severe erosion. Based on these results, IDEM removed the stream from its 2020 impaired waters list.

Implementing Agricultural Best Management Practices Revitalizes the Fish Community in Boyles Ditch

Boyles Ditch is a small stream in the northern portion of the Kilmore Creek subwatershed, which is in the SFWC watershed in Clinton County (Figure 5, Appendix B). Boyles Ditch is surrounded by cultivated crops. While the main stem of Kilmore Creek contains a substantial amount of forested stream buffer, Boyles Ditch remains largely unbuffered from NPS runoff. According to the 2012 SFWC WMP, roughly 14 of the 21.5 miles of waterways in the Kilmore Creek subwatershed are listed as impaired, including all of Boyles Ditch and downstream portions of Kilmore Creek. In 2004, IDEM conducted a biological study on the SFWC watershed. Three sampling sites on Boyles Ditch had failing index of biotic integrity (IBI) scores indicating that the stream was not supporting a well-balanced aquatic community.

In 2005, the Clinton County Soil and Water Conservation District (SWCD) received a CWA section 319 grant to create the SFWC–Blinn Ditch and Kilmore Creek–Boyles Ditch WMP, which IDEM approved in 2008. In 2005–2012, organizations in the watershed collaborated to conduct education and outreach through stakeholder meetings, public workshops, field days, newsletters, and community cleanups. Workshop topics included the use of cover crops, proper septic system management, and soil health maintenance.

Various partners implemented projects in the SFWC watershed (Table 7, Appendix A). In the late 1990s, IASWCD undertook efforts to provide strategic planning and technical assistance to the larger Wildcat Creek watershed using $189,500 in CWA section 319 funding. In 2006, the Wildcat Creek Watershed Alliance assumed implementation of the Wildcat Creek WMP using $150,000 in CWA section 319 funding. The U.S. Department of Agriculture's (USDA's) Natural Resources Conservation Service provided additional funding and technical assistance through programs in the Kilmore Creek subwatershed in 2004–2017, totaling $7,017,438. The USDA Farm Services Agency's Conservation Reserve Program (CRP) provided $6,185 in funding for various conservation practices and floodplain restoration. Between 2001 and 2017, the SWCD used funding sources ($754,628 from private funds and CWA section 205(j) and 319 funds) to write a nine-element plan specific to the SFWC watershed and to provide cost share for best management practices (BMPs). Lastly, the SWCD used $337 in local funds to decommission a well.

IDEM conducted follow-up monitoring on Boyles Ditch in 2017 and found that the fish IBI score improved to 54, a significant increase from the score of 34 seen in 2004 and well above the minimum IBI score of 36 needed to indicate support. Additionally, the Qualitative Habitat Evaluation Index (QHEI) score was 69 in 2017, up from 47 in 2004 (QHEI scores below 51 indicates poor habitat). Based on these results, IDEM removed Boyles Ditch from its 2020 impaired waters list

Grand Calumet River Indiana Harbor Ship Canal Area of Concern Remedial Action Plan

The Grand Calumet River, located in Lake County in far northwestern Indiana, is a complex river system heavily modified by 200 years of industrialization and other human activities. The Grand Calumet is comprised of two east-west oriented branches that meet at the southern end of the Indiana Harbor Ship Canal (IHSC). The IHSC, in turn, extends north from its junction with the East and West branches of the Grand Calumet River to the Indiana Harbor. The Lake George Branch is a two-mile east-west branch of the IHSC.

Prior to the adoption of strict environmental regulations under the federal Clean Water Act, industries and municipal sanitary districts commonly discharged chemicals and contaminants directly into the Grand Calumet River and the IHSC. Such pollution, which consisted of oils and greases, heavy metals, human waste, and other industrial chemicals, accumulated in the sediments at the river bottom and along the adjacent wetlands. This accumulated pollution caused significant harm to the ecosystem and reduced the ability of the river system to provide several beneficial ecosystem services, such as clean water for drinking, wading, and industrial use; heathy fish and wildlife; and healthy, aesthetically pleasing environments.

By the 1970s, new environmental regulations changed how municipalities and industries could operate. This drastically reduced the amount of contaminants discharged into the river. However, even with new operational standards, legacy contaminants – those discharged prior to the change in regulations – continued to cause great harm to the river. Moreover, through its connection to Lake Michigan at the Indiana Harbor, the impairments to the Grand Calumet River had the potential to negatively impact water quality in the Great Lakes. The Grand Calumet River watershed, which also includes Wolf Lake, Lake George, and portions of the Indiana Lake Michigan shoreline, also faced numerous threats to native habitat from non-native invasive species. This combination of factors led the International Joint Commission (IJC), a binational organization made up of representatives of the United States and Canada, to list the region as one of 43 designated Areas of Concern (AOCs) within the Great Lakes Basin.

Under the 1987 Great Lakes Water Quality Agreement (GLWQA), the United States and Canada required the development of a Remedial Action Plan (RAP) for all AOCs including the Grand Calumet River/Indiana Harbor Ship Canal AOC to serve as a blueprint for the restoration of critical ecosystem services. The goal of the RAP is to identify the remedial actions necessary for removing each of the following 14 designated beneficial use impairments (BUIs):

1. Restrictions on fish and wildlife consumption.
2. Tainting of fish and wildlife flavor.
3. Degradation of fish and wildlife populations.
4. Fish tumors or other deformities.
5. Bird or animal deformities or reproduction problems.
6. Degradation of benthos (bottom-dwelling organisms).
7. Restriction on dredging activities.
8. Eutrophication or undesirable algae.
9. Restrictions on drinking water consumption, or taste and odor problems.
10. Beach closings.
11. Degradation of aesthetics.
12. Added costs to agriculture and industry.
13. Degradation of phytoplankton and zooplankton populations.
14. Loss of fish and wildlife habitat.

In Indiana, IDEM took the lead in developing the RAP for the Grand Calumet River AOC and appointed a group of individuals representing a diverse set of regional stakeholders to the Citizens Advisory for the Remediation of the Environment (CARE) Committee. Since 1990, the CARE Committee has provided valuable input into the RAP planning process.

The RAP identifies key projects needed to remove the 14 BUIs impacting the Grand Calumet River AOC. These include management of contaminated sediment for the entire river system, restoration of approximately 900 acres of native dune and swale and wetland habitat, and reduction of *E. coli* sources resulting in beach closures at AOC beaches. To date, funding for projects that support the removal of BUI impairment has been provided by the Great Lakes Legacy Act (GLLA), Great Lakes Restoration Initiative (GLRI), Natural Resource Damages Co-Trustees, and other state and local sponsors.

As a result of these partnerships, significant progress has been made toward the RAP sediment management goals. Since 2002, more than 3.0 million cubic yards of contaminated sediments containing heavy metals, oil and grease, polycyclic aromatic hydrocarbons (PAHs), and polychlorinated biphenyls (PCBs) have been removed. To date, 1.3 million cubic yards have been contained in-place using a reactive cap. In addition, federal, state, and local partners have begun a project to manage contaminated sediment within the Lake George Branch of the IHSC.

The Clean Water Act and Indiana law require the abatement of combined sewer overflows (CSOs). Municipalities with CSO discharges into the Grand Calumet River have committed to reduce these discharges through state and federal enforceable mechanisms. The reduction of CSOs in the system has led to enhanced water quality and aesthetics along the West Branch of the Grand Calumet River. Hammond, Gary, and East Chicago are required by their NPDES permits to fully implement long-term control plans (LTCPs) to abate CSO discharges.

Habitat restoration has also been a priority for the RAP partnerships, with GLLA projects completing restoration of 84 acres of wetland and riverine marshes, including Roxana Marsh in East Chicago, Indiana and Seidner Dune and Swale Nature Preserve in Hammond, Indiana. In addition, the GLRI is funding the restoration of approximately 900 acres of State- and locally-managed habitat throughout the AOC. Managed properties such as Clark and Pine Nature Preserve, DuPont Natural Area, and Gibson Woods Nature Preserve protect globally rare dune and swale habitats and others where some of the largest concentrations of threatened and endangered species in the state are found.

Monitoring throughout the restoration process is essential to ensure work stays on track to meet restoration goals. IDEM has implemented monitoring projects to assess plant, fish, benthic, and plankton communities, water chemistry, and aesthetics within the AOC. In addition, the agency has provided GLRI funds to universities and federal agencies to conduct microbial source tracking at AOC beaches.

In 2011 and 2012, respectively, BUI #12 (Added costs to agriculture and industry) and BUI #9 (Restrictions on drinking water consumption, or taste and odor problems) were removed from the list of beneficial use impairments for the Grand Calumet River AOC. IDEM and the CARE Committee continue to work diligently to identify and implement the remaining management actions necessary to remove the 12 remaining BUIs and eliminate the Grand Calumet River/Indiana Harbor Ship Canal AOC from the list of Great Lakes AOCs maintained by the IJC, a process known as BUI delisting.

SPECIAL STATE CONCERNS AND RECOMMENDATIONS

Reductions in federal and state resources for data collection and analysis coupled with increased federal directives and competing policy and program objectives continue to strain the ability of the IDEM to optimize its limited resources to monitor Indiana waters in support of OWQ programs and emerging state priorities.

IDEM acknowledges that fiscal responsibility may necessitate reductions in funding and staffing levels. In light of these constraints, IDEM recommends the following actions:

- Increase states' flexibility to allocate the federal funding it receives to take advantage of and optimize other funding sources.
- Combine supplemental and base funding to states provided through CWA Section 106 funds so that in lean times, the U.S. EPA may consider maintaining current monitoring efforts a valid use of supplemental funds.
- Acknowledge the continuum of progress demonstrated by social indicators or other factors in addition to measurable water quality improvements.

SURFACE WATER MONITORING AND ASSESSMENT

The IDEM conducts most of its surface water monitoring through various programs in the Watershed Assessment and Planning Branch (WAPB). This section includes a discussion of IDEM's surface water monitoring strategy, a description of the assessment methodology for classifying all surface waters according to the degree to which they meet their designated uses, and the most current assessment results available. This section also provides an analysis of surface water quality trends and information on public health issues.

IDEM'S SURFACE WATER MONITORING STRATEGY

The mission of the OWQ at the IDEM is to monitor, protect, and improve Indiana's water quality to ensure its continued use as a drinking water source, habitat for wildlife, recreational resource and economic asset. The OWQ has developed a water quality monitoring strategy (WQMS) to support this mission and to facilitate an adaptive management process that helps to ensure that its monitoring programs are providing the data required by OWQ's programs and to meet emerging concerns.

The U.S. EPA recommends ten elements that states should include in their water monitoring strategies in order to meet prerequisites of the federal Clean Water Act (CWA) Section 106 (U.S. EPA, 2003). The *Indiana Water Quality Monitoring Strategy*, *2017-2021* refines the previous *Indiana Water Quality Monitoring Strategy 2011-2019*, which marked a significant change in monitoring designs. An interdisciplinary work group comprised of staff members from several programs within the OWQ, including monitoring staff members responsible for collecting the water quality data needed to meet IDEM water management needs, developed the strategy to cover the following OWQ monitoring activities:

- Probabilistic monitoring in one basin per year on a nine-year rotating basin cycle (Figure 6, Appendix B).
- Fixed Station monitoring at 165 sites across the state (two added in 2014 to support the Natural Resource Conservation Service National Water Quality Incentive program).
- Fish tissue and sediment contaminants monitoring on a five-year rotating basin cycle.
- Targeted (watershed characterization) monitoring for total maximum daily load (TMDL) reassessments and development, watershed baseline planning, and performance measures determinations.
- Cyanobacteria monitoring of 16 beaches at 12 lakes, one dog park lake, and lakes used for training public safety dogs.
- Special studies, reference site monitoring, and remediation follow-up sampling.
- Thermal verification studies.
- Hoosier Riverwatch (HRW) program citizen volunteer monitoring.

OWQ contracts with the Indiana University School of Public and Environmental Affairs to administer the Indiana Clean Lakes Program (CLP). The Indiana CLP, which is discussed in more detail earlier in this report, provides most of the lakes data OWQ needs for its programs.

Through its surface water monitoring programs, OWQ collects surface water quality data, biological community and habitat data to help meet one or more of the following objectives, which are included in the WQMS (Table 8, Appendix A):

- To fulfill requirements of the CWA Sections 305(b), 303(d) and 314 to assess all waters of the state to determine if they are meeting their designated uses and to identify those waters that are not.
- To support OWQ programs including WQS development, NPDES permitting, and compliance.
- To support public health advisories and address emerging water quality issues.
- To support watershed planning and restoration activities.
- To determine water quality trends and to evaluate the performance of programs.
- To engage and support a volunteer monitoring network across the state.

IDEM ranks the monitoring activities related to U.S. EPA priorities or requirements and those related to the protection of human health as the agency's primary priorities and ranks all others as secondary priorities based on resource constraints and other factors including the degree to which they meet the OWQ mission.

DATA QUALITY ASSURANCE AND QUALITY CONTROL

To ensure the quality of the data used in the IDEM's Clean Water Act Section 305(b) assessments, all surface water monitoring is conducted in accordance with IDEM's quality assurance project plan (QAPP) for its surface water monitoring programs. This QAPP is part of IDEM's overall quality management plan approved by the U.S. EPA and complies with U.S. EPA guidance (U.S. EPA, 2002). IDEM revised its surface water monitoring QAPP most recently in March 2017.

The QAPP outlines specific data quality objectives and serves as a tool for planning for the collection of environmental data to support IDEM Office of Water Quality needs. Additionally, the QAPP describes a well-defined data quality assessment process for reviewing analytical data and categorizing analytical results in one of four levels of data quality. IDEM uses these data quality levels to determine the usability of the data for water quality assessments and other decisions.

DATA MANAGEMENT

Management of Water Quality Monitoring Data

The Watershed Assessment and Planning Branch (WAPB) in IDEM's OWQ maintains its surface water quality data in the Assessment Information Management System (AIMS) database. AIMS houses several types of data including surface water chemistry data, fish and macroinvertebrate community data, assessments of habitat quality, results from algal monitoring, and fish tissue and sediment contaminant data.

IDEM uploaded water chemistry and fish community results collected by OWQ's water quality monitoring programs prior to 2017 into the new U.S. EPA EnviroFacts Data Warehouse through the Water Quality Exchange (WQX). IDEM continues to make modifications to the AIMS database to improve quality control and usability of results uploaded through the WQX.

Recent modifications to the AIMS database now allow for more efficient datasheet upload and retrieval with additional search functions for faster query building through a user-friendly interface for staff members. AIMS also now allows for storage of additional water quality data from NPS projects (including estimated load reductions) and third-party datasets for potential use in assessing waters for the integrated report. IDEM also receives data from NPS Program projects for import into the AIMS database. IDEM is currently developing standard operating procedures for receiving, assessing, and importing water quality data from third-party sources to make them more readily available for potential use in IDEM's water quality assessments.

Table 4 of this report shows load reduction estimates provided by the NPS project sponsors, which are housed in AIMS and reported to U.S. EPA through its Grants Reporting and Tracking System. These load reductions are estimated using models and help to inform the evaluation of water quality sampling data collected by the project sponsors and IDEM WAPB staff members.

Management of Water Quality Assessment Information

IDEM maintains its water quality assessment information in U.S. EPA's Assessment, Total Maximum Daily Load (TMDL) Tracking and Implementation System (ATTAINS). CWA Section 305(b) assessment decisions made based on water monitoring data (physical, chemical and biological monitoring results) stored in the AIMS database.

In ATTAINS, water quality assessment information is associated with a specific waterbody assessment unit (AU), which is assigned a unique assessment unit identifier (AUID). IDEM uses a process called reach indexing to define the geographical extent and location of each AU within a given watershed based on its 12- or 14-digit HUC for mapping purposes. Reach indexing uses tools that work

within geographical information systems (GIS) software to associate one or more reaches of a given waterbody to a single AU and to "key" these AUs to the National Hydrography Dataset (NHD)[1]. IDEM calls this "key" its Reach Index. By associating the information in ATTAINS to its geographic location, the Reach Index allows IDEM to display assessment information on a map using GIS software.

IDEM's Reach Index for streams maps all Indiana streams visible on the NHD's high-resolution (1:24,000-scale) dataset, while the Reach Index for Indiana's lakes remains mapped at medium resolution (1:100,000-scale).

IDEM tracks all the Indiana lakes included in the Reach Index and Lake Michigan individually in ATTAINS with a unique AUID based on the 12-digit watershed in which they are located. IDEM has divided Indiana's Lake Michigan shoreline into five separate AUs with AUIDs based on the 8-digit HUC in which each shoreline reach is located.

When developing its Reach Index for streams, IDEM defined reaches of varying sizes. IDEM divided the Ohio River into 69 AUs ranging in size between 2-14 miles and with AUIDs associated with the 8-digit HUCs in which they are located. IDEM divided or combined other Indiana rivers and streams in the Reach Index into one or more AUs, assigning each an AUID based on the 12-digit HUC in which it is located. The length of a stream AU can vary, and a single AU may or may not represent the entire stream to which it is associated. For example, for its Reach Index, IDEM divided large rivers into smaller, separate AUs and grouped many smaller streams together into individual "catchment" AUs based on hydrology and other factors that can affect water quality.

In this report, IDEM provides assessment information for Indiana lakes in terms of lake acres. IDEM reports information for Lake Michigan in terms of acres and the information for its shoreline reaches in miles. IDEM reports assessment information for streams in terms of miles.

WATER QUALITY ASSESSMENTS

Indiana's water quality standards (WQS) provide the basis for the IDEM's CWA Section 305(b) water quality assessments and are set to protect the designated uses for Indiana waters. IDEM's water quality assessments determine the degree to which Indiana's waterbodies are supporting aquatic life use, recreational uses, and fish consumption uses. IDEM also assesses drinking water use support on surface waters that serve as a public water supply or which influence a ground water supply serving as a source water. There are additional uses for Indiana waters described in the state's WQS. However, IDEM limits its assessments to these four because the criteria in place to protect them are more stringent than those necessary to protect other uses. Thus, by protecting these uses, other uses such as agricultural and industrial uses are also protected.

[1] The NHD is a database created by the U.S. EPA and the United States Geological Survey that provides a comprehensive coverage of hydrographic data for the United States. It uniquely identifies and interconnects the stream segments that comprise the nation's surface water drainage system and contains information for other common surface waterbodies such as lakes, reservoirs, estuaries, and coastlines.

Water Quality Data Used to Make Designated Use Assessments

IDEM considers all existing and readily available data in its CWA Section 305(b) water quality assessment process, including data collected by IDEM's water quality monitoring programs as well as external sources whenever possible. Internally, IDEM draws from the following monitoring programs:

- Probabilistic Monitoring Program.
- Fixed Station Monitoring Program.
- Contaminants Monitoring Program.
- Performance Measures Monitoring Program.
- Special Studies Program.
- Watershed Characterization Program.

In addition to the water quality data IDEM collects, the agency reviews data from other sources for potential use in its CWA assessments, including data collected through partnerships with other state and federal agencies and by IDEM's Nonpoint Source Program grant projects, including the Indiana Clean Lakes Program.

IDEM is committed to making greater use of external data not only in its CWA Section 305(b) assessments but wherever possible in all its OWQ programs. IDEM's External Data Framework (EDF) provides a systematic, transparent, and voluntary means for external organizations to share the water quality data they collect with IDEM for possible use in its CWA assessment and listing processes and other OWQ programs.

Currently, IDEM is working to create a new tool to make developing a quality assurance project plan (QAPP) – a document that provides all the information IDEM needs to perform a thorough data quality review – easier for organizations interested in sharing their water quality data through the EDF.

IDEM's QAPP Tool will provide a series of forms online that participants can work through in one or more sessions and which, when completed will provide a fully developed QAPP to support their monitoring efforts and provide all the information needed to determine the quality of the data they collect. Here are a few of the features this new tool will include:

- An online library full of materials linked to relevant sections of the QAPP that participants can use to better understand the content required in that section.
- An automated messaging system that streamlines communications so that participants can ask questions that are automatically keyed to the specific section of the QAPP they're working on so IDEM can more quickly address them.
- A user-friendly interface with the ability to save the QAPP in progress and a one-click submittal of the QAPP for IDEM review.

By making it easier for EDF participants to develop the documentation needed to evaluate their data, IDEM expects the QAPP Tool to facilitate greater participation in the EDF potentially resulting in more water quality data available for CWA 305(b) assessments. When its development is complete, IDEM will make the QAPP Tool freely available on its website for organizations in Indiana and elsewhere for use in documenting their data quality. External organizations can learn more about the EDF and how to submit their data on the agency's EDF website at www.in.gov/idem/cleanwater/2485.htm.

Water Quality Assessments at Two Spatial Scales

Much of the data IDEM collects and receives from external sources are reach-specific, meaning the results can be applied only to the waterbodies from which the samples were collected and for which they are representative. However, IDEM's Probabilistic Monitoring Program provides data that can be used to make water quality assessments of rivers and streams at two spatial scales – reach-specific assessments and basin-wide assessments.

Reach-specific Use Support Assessments

IDEM uses the data collected by the Probabilistic Monitoring Program to make use support assessments of the stream or stream reach from which they were collected and any other reaches for which the results are representative. For these assessments, IDEM compares sampling results to applicable water quality criteria to determine whether the reach or reaches assessed are supporting their designated uses. The "Rivers and Streams Water Quality Assessment" section of this report summarizes the results from IDEM's reach-specific assessments for streams. In addition to data collected through the Probabilistic Monitoring Program, IDEM also uses data collected by the agency's other water monitoring programs to make reach-specific assessments and may use data from external sources if they meet the necessary data quality requirements.

Comprehensive Use Support Assessments

Comprehensive assessments are statistical calculations that allow IDEM to predict with reasonable certainty the percentage of Indiana's rivers and streams within a given area that are either impaired or supporting their designated uses. IDEM calculates its comprehensive use support assessments solely based on the reach-specific assessment results from data collected by the Probabilistic Monitoring Program because, unlike data collected through other IDEM monitoring programs and most external organizations, IDEM employs a probability-based sampling design for site selection, which is necessary to make statistically valid calculations.

IDEM's comprehensive use support assessments and its reach-specific assessments of designated use support provide water quality information in two very different ways, and IDEM uses both types of assessments to meet CWA requirements. The agency's comprehensive assessments provide statistically valid statements about the overall water quality throughout Indiana on a basin level, which allows IDEM to meet the CWA requirement to assess all the waters of the state.

IDEM reports its comprehensive assessment results in terms of the percentage of the total stream miles in each basin meeting their designated uses and the percentage that are impaired. IDEM derives these percentages using statistical methods and therefore cannot apply them to specific streams or stream reaches. Given this, comprehensive assessments do not identify where specific impairments exist as required by Section 303(d) of the CWA. IDEM's reach-specific assessments provide this information, identifying the specific location of impairments. IDEM uses data collected from a variety of sources including IDEM's Probabilistic Monitoring Program to make its reach-specific assessments.

This integrated report provides comprehensive assessments for watersheds in all of Indiana's major basins (Appendix H) and summary results from IDEM reach-specific assessments in keeping with CWA Section 305(b) (Appendix A). It also includes the 2020 finalized 303(d) List of Impaired Waters (Appendix L), which identifies waters impaired for one or more designated uses as required by CWA Section 303(d).

This report builds on the water quality assessment results reported in the 2018 Indiana Integrated Water Monitoring and Assessment Report and includes updated assessments for the Upper Illinois River Basin monitored in 2017 and the Great Lakes Basin monitored in 2018. This report also contains

assessment information based on targeted monitoring for total maximum daily loads (TMDLs) or watershed characterization studies, performance measures determinations, and special studies developed in other basins throughout Indiana.

Water Quality Assessment Methodology

IDEM conducts its CWA Section 305(b) water quality assessments in accordance with its Consolidated Assessment and Listing Methodology (CALM) (Appendix G). For each designated use and waterbody type, IDEM compares the available data with the applicable WQS following the methods articulated in the CALM. IDEM enters the results of its water quality assessments into U.S. ATTAINS and then uses the data to compile its 303(d) List of Impaired Waters (Appendix L) and Consolidated List (Appendix M).

Assessment Methods for the Ohio River

IDEM collaborates with the Ohio River Sanitation Commission (ORSANCO) to conduct water quality assessments of the Ohio River reaches that border Indiana. ORSANCO is an interstate water pollution control agency established for the Ohio River through a compact agreement between member states and approved by Congress. Under the terms of the compact, member states cooperate in the control of water pollution in the Ohio River Basin.

ORSANCO collects most of the data used to make water quality assessments and works with the states in the compact to determine the degree to which the Ohio River is meeting its designated uses. Based on the results of this collaborative assessment, ORSANCO produces a CWA Section 305(b) water quality assessment report for the Ohio River every two years. Member states then incorporate those results into their individual CWA 303(d) lists in accordance with their individual 303(d) listing methods. IDEM's CALM (Appendix G) provides a more detailed discussion of Ohio River assessments.

Although the assessment methodology for the Ohio River differs somewhat from the methods IDEM uses to assess other Indiana rivers and streams, IDEM combines the assessment results for all rivers and streams in Indiana, including the Ohio River for the purposes of this report.

Assessment Methods for Public Water Supply

In 2018, IDEM finalized methods for determining use support of waters serving as a source water for public water supply facilities. To date, IDEM has made few new assessments of use support on Indiana source waters, primarily due to the lack of data available for assessment. IDEM knew when developing the methods that there were very little existing and readily available data to implement them, but proceeded based on the expectation that previously unidentified data may become available through the EDF.

IDEM currently lacks the resources to support a new monitoring program dedicated to monitoring source waters for public water supplies. However, the agency continues to explore strategies for increasing the amount of available data for source water assessments and is working with its Drinking Water Branch to identify ways to potentially partner with drinking water facilities to facilitate the collection of data that may be used for the assessment of their source water.

IDEM believes that its new public water supply assessment methods, coupled with more readily available data for assessments, will result in greater protection of surface waters that serve as source waters for Indiana's public water supplies going forward.

REPORTING WATER QUALITY ASSESSMENT RESULTS

Indiana's Consolidated List

For the purposes of Clean Water Act (CWA) 305(b) reporting, the Indiana Department of Environmental Management (IDEM) employs a multi-category approach in which every waterbody is placed into one of five categories (or subcategories) for each of the following designated uses: aquatic life use, recreational use, fish consumption[2], and public water supply[3].

The state's Consolidated List (Appendix M) provides a full inventory of Indiana waters for the purposes of assessment including information regarding the degree to which they are supporting their designated uses.

IDEM assesses a waterbody as fully supporting a designated or other use when it finds it to be meeting the water quality standards (WQS) applicable to that use. When a waterbody is not meeting one or more of the applicable standards, IDEM considers it impaired, meaning it is not fully supporting the designated use. Figure 7 (Appendix B) illustrates the decision-making process IDEM uses to determine the appropriate category for each designated use. IDEM's Consolidated Assessment and Listing Methodology (CALM) (Appendix G) provides a more detailed explanation of the five categories and their subcategories summarized here:

Category 1	The available data and/or information indicate that the waterbody is supporting all of its designated uses and that no use is threatened.
Category 2	The available data and/or information indicate that the waterbody is supporting the individual designated use under consideration.
Category 3	The available data and/or other information are insufficient data to determine if the waterbody is supporting the individual designated use under consideration.
Category 4	The available data and/or information indicate that the waterbody is not supporting the individual designated use (that the use is impaired or threatened), but a total maximum daily load (TMDL) is not required.
Category 5	The available data and/or information indicate the waterbody is not supporting the individual designated use (that the use is impaired or threatened), and a TMDL is required.

The 303(d) List of Impaired Waters is a subset of the Consolidated List and includes only Category 5 waters – those for which a TMDL is required. The CWA Section 303(d) List of Impaired Waters is subject to approval by the United States Environmental Protection Agency (U.S. EPA).

On May 8, 2013, U.S. EPA partially approved Indiana's 2010 303(d) List of Impaired Waters. U.S. EPA based its partial approval on concerns regarding IDEM's methods for evaluating metals data for the purposes of determining impairment. On May 9, 2019, U.S. EPA notified IDEM that it had consolidated its review of Indiana's 2012, 2014, 2016, and 2018 303(d) lists. In its approval letter, U.S. EPA concluded that IDEM has met the requirements of Section 303(d) of the federal Clean Water Act and all applicable requirements in the Code of Federal Regulations for all waters submitted on its 303(d) lists to date. However, U.S. EPA has deferred action on certain waters with regard to metals' issues that U.S EPA and IDEM have yet to resolve. More detailed information regarding U.S. EPA's consolidated approval

[2] Fish consumption is not a designated use in Indiana's WQS. IDEM assesses Indiana waters for fish consumption pursuant to current U.S. EPA policy and in keeping with CWA goals, which are reflected in Indiana's WQS (327 IAC 2-1-1.5 and 2-1.5-3).
[3] Applicable only to waters that serve as a routine or emergency source of water for a public water system.

can be found online at https://www.in.gov/idem/nps/2647.htm.

While the issues delaying full approval by U.S. EPA remain unresolved, IDEM continues to conduct water quality assessments and remains committed to reporting the results of its assessments to the public in a timely manner.

To ensure that Indiana's 303(d) list contains the most up-to-date assessment information, each 303(d) list builds upon the list developed for the previous two-year reporting cycle. Therefore, the 2020 303(d) list included with this report reflects the cumulative results of IDEM's CWA assessments to date.

The draft 303(d) list for 2020 was prepared and published in the Indiana Register for a state-required 90-day public comment period beginning on January 29, 2020 and ending on April 29, 2020. No comments were received during this time. However, IDEM did receive comments from U.S. EPA regarding the draft 303(d) list and the CALM. The narrative portion of the public notice is provided in Appendix J. IDEM's responses to U.S. EPA's comments can be found in Appendix K. All the materials for Indiana's finalized 2020 303(d) list (included in Appendix L of this report) can be found on the Office of Water Quality Web site at: www.in.gov/idem/nps/2647.htm.

CLEAN WATER ACT SECTION 305(B) ASSESSMENTS

The following sections of this report provide summary assessment results indicating designated use support for waters throughout Indiana based on waterbody type. Each section provides a table in Appendix A summarizing the total number of stream miles and lake acres supporting and not supporting their individual designated uses. It should be noted that these values are not additive because a single waterbody has 3-4 designated uses and can have one or more impairments for a single use. For example, adding together the mileage values for two different impairments on the same stretch of stream would result in an inaccurate picture of impairment by doubling the size of the actual stream reach.

Appendix A provides summary results regarding the parameters causing or indicating impairments, and their potential sources for each type of waterbody. As with the values in the summary tables for designated use support, the summary values in each table are not additive. Summing them would artificially inflate the number of miles or acres actually impaired.

Causes of impairment identified in the summary tables are those pollutants or other stressors that contribute to the impairment of the designated uses of a waterbody. In some cases, IDEM was able to identify only the symptom(s) of impairment. For example, the IDEM may have evidence that one or more of the biological communities (fish or aquatic insects and other macroinvertebrates) in a waterbody are impaired, but often the data are insufficient to determine the actual pollutant or stressor causing the impairment. In these cases, the biological integrity of the waterbody is impaired[i], which is really a symptom of one/more unknown sources.

The sources shown in the summary tables in Appendix A represent activities that may be contributing the pollutant(s) or creating other stressors that result in impairment of a designated use. For most assessments, IDEM was unable to identify precisely the sources of a given impairment. This is because most of the water quality monitoring IDEM conducts and the assessment methods the agency uses to evaluate the results of that monitoring are designed to identify impairments not sources.

Accurately attributing a given impairment to specific sources is difficult at best without more detailed and resource intensive sampling and analyses and is often impossible to do with an acceptable degree of certainty. Based on its limited resources, IDEM typically reserves this more resource-intensive monitoring for TMDL development, which requires the identification of sources in order to develop recommended loadings to support its restoration. In contrast, the sources IDEM identifies during its initial designated use assessments represent those determined by IDEM staff members to be the most likely but not proven sources given a variety of factors, which include but are not limited to the following:

- Land uses (as indicated by field observations and land use data from published sources such as the U.S. Geological Survey Gap Analysis Program, aerial photography, etc.).
- Field observations of potential sources such as illegal straight pipes, tillage to the stream's edge, livestock in the stream, etc.
- The presence of permitted facilities within close proximity of the impaired waterbody in cases where the waterbody is impaired for something that one might reasonably expect to be associated with the discharge of those facilities.
- Naturally occurring conditions that could contribute to impairment.

IDEM believes that by using best professional judgment, scientists can distinguish the most likely sources of impairment in the watershed and provide a starting point for a TMDL, watershed planning or other activities aimed at restoring the waterbody.

Rivers and Streams Water Quality Assessment

IDEM assesses Indiana's rivers and streams for support of aquatic life use, recreational uses, and fish consumption. Where there is sufficient data, rivers and streams that serve as a source water for a public water supply, IDEM can also determine the degree to which they support that use.

Table 9 (Appendix A) shows the number of stream miles in Indiana that IDEM has assessed to date, and the number of miles fully supporting and impaired are shown for each individual use.

Table 10 (Appendix A) represents the total miles of streams affected by each cause/stressor in Indiana. These tables include identified causes of impairment and symptoms of other observed effects such as impaired biotic communities and low dissolved oxygen. For these and other observed effects, the substance(s) and/or stressors remain unknown. Table 11 (Appendix A) includes all the potential sources that may be contributing to one or more of the impairments in Table 10, and the total stream miles impaired due to each. The metadata for this report, which in included in Appendix C, provides IDEM's definitions for all potential sources are shown in Table 10 and include agricultural sources and those resulting from urban activities and land development. Illicit connections identify "straight pipes" from buildings in unsewered areas that flow into state waters with little or no treatment. Contaminated sediments are largely due to polychlorinated biphenyls (PCBs) that correlate with elevated PCB levels in fish tissue.

Great Lakes Shoreline Water Quality Assessment

IDEM has assessed Indiana's entire portion of the Lake Michigan shoreline as fully supporting of aquatic life use and fully supporting of its use as a public water supply for the 35 miles so designated. IDEM has found all 67 miles of the shoreline in Indiana to be impaired for recreational use and fish consumption. The U.S. EPA approved the required TMDLs IDEM developed for the impairments of recreational use along Lake Michigan's shoreline in 2004: www.in.gov/idem/nps/2856.htm. As a result, IDEM has placed the shoreline reaches impaired for *E. coli* in Category 4 of Indiana's Consolidated List while the fish consumption impairments for PCBs and mercury in fish tissue remain in Category 5 (Indiana's 303(d) list).

Table 12 (Appendix A) provides summarizes IDEM's assessment results for the Lake Michigan shoreline. Table 13 (Appendix A) identifies the specific causes of impairment and the potential sources that may be contributing to them are summarized in Table 14.

Lake Michigan Water Quality Assessment

To date, fish consumption is the only designated use for which IDEM has had sufficient data upon which to make water quality assessments for Lake Michigan. IDEM has treated Lake Michigan as a single assessment unit for the purposes of this assessment, which means that any impairment identified in any part of the lake applies to all 154,176 acres of Lake Michigan within Indiana's borders. Assessments of Indiana waters of Lake Michigan indicate impairment for mercury and PCBs in fish tissue. Tables 15-17 (Appendix A) reflect the results of these assessments.

Water Quality Assessments of Other Lakes

IDEM conducts two types of assessments on Indiana Lakes. CWA Section 314 requires States to report on the trophic status and trends of all publicly owned lakes in Indiana, and CWA Section 305(b) requires States to report on the degree to which Indiana's lakes and reservoirs are supporting their designated uses. IDEM's Consolidated Assessment and Listing Methodology (CALM) (Appendix G) describes both types of assessments and the methods IDEM uses to conduct them.

IDEM evaluates lakes primarily for recreational uses and fish consumption for the purposes of CWA Section 305(b) assessments. While IDEM monitors several lakes for fish consumption, other types of monitoring for determining designated use support assessments of Indiana lakes is limited. As a result, IDEM's assessments have relied primarily on external data collected through the Indiana Clean Lakes Program (CLP) for the purposes of CWA Section 314 assessments.

The monitoring conducted by the Indiana CLP provides results for all the parameters necessary to calculate Carlson's Trophic State Index (TSI) (Carlson, 1977) scores, which allows IDEM to make both CWA Section 314 trophic state assessments and some CWA Section 305(b) assessments for recreational use. However, IDEM does not consider the individual parameter results or the TSI scores sufficient for determining the condition of biological communities for the purposes of determining aquatic life use support.

Use support assessments of lakes for public water supply are also limited but for different reasons. Compared to other designated uses, which apply to all waters of the state, these assessments are made only for the relatively few lakes and reservoirs in Indiana that are used directly or indirectly as source water for public water supplies.

IDEM's CALM (Appendix G) provides a detailed description of the agency's assessment methods for CWA Section 305(b) assessments of lakes and reservoirs. Table 18-20 (Appendix A) provides summary assessment results for the 2020 cycle.

CWA SECTION 314 ASSESSMENTS

Section 314 of the federal Clean Water Act (CWA) requires States to report on the tropic status and trends of all publicly owned lakes in Indiana. To determine the trophic state for a given lake (the amount of biomass present at the time the measurement is taken), the IDEM uses Carlson's TSI, which can be calculated for three variables – Secchi depth, total phosphorus (TP), and Chlorophyll-*a* (CHL). Each of these variables provide independent indicators of the trophic state of the lake or reservoir in question. Together, they help understand the potential drivers of trophic condition. However, while any of the three can be used to determine trophic state, IDEM uses the TSI for CHL to make its trophic state assessments because CHL concentrations provide a more direct measure of phytoplankton abundance than Secchi depth or TP.

IDEM classifies lakes based on their trophic condition as indicated by TSI (CHL) scores. Higher scores are an indicator of nutrient enrichment, which can come from both natural sources and sources related to human activities. IDEM's CALM (Appendix G) provides more details on how the TSI (CHL) scores are calculated.

For the purposes of CWA Section 314, IDEM reports only on the lakes it has assessed, placing each into one of four classes based on its trophic state. Table 21 (Appendix A) provides the definition for the different trophic classes. Table 22 (Appendix A) provides a summary of the trophic status information for all lakes assessed to date. , and Table 23 summarizes trends in the trophic condition for Indiana lakes, which are determined based on changes in the trophic state over time. Approximately 19 percent of the lakes assessed to date (20 percent of the acres assessed) show some water quality improvement as measured by a reduction in their trophic scores. Forty-one percent of the lakes assessed (23 percent of the acres assessed) appear to have relatively stable trophic conditions. Thirty-six percent of the lakes assessed to date (53 percent of the acres assessed) show an increase in their trophic scores indicating that the trophic conditions are degrading.

The water quality trend appears to be fluctuating for four percent of the lakes (four percent of the acres assessed). For these lakes, the lack of detectable trend may be due to abnormal seasonal effects or changing activities in the surrounding watershed. In cases where the available data are insufficient to determine a trend, IDEM reports the trend as unknown. Appendix I provides all of IDEM's waterbody-specific results for trend and trophic status and trends for Indiana's lakes and reservoirs.

PUBLIC HEALTH/AQUATIC LIFE CONCERNS

Toxic substances, including some that are currently in use as well as "legacy" contaminants, can be found in surface waters throughout the United States. Some toxins occur naturally in the environment. Regardless of the source, the release of toxic materials into the aquatic environment can threaten public health by contaminating drinking water supplies, fish and shellfish, and recreational waters. Their impacts can include:

- Contaminants present in acutely toxic amounts may kill fish or other aquatic organisms directly.
- Substances present in lesser, chronically toxic amounts can reduce densities and growth rates of aquatic organisms and/or become concentrated in their body tissues.
- Human beings can inadvertently ingest toxins through the consumption of affected organisms, which can in turn, accumulate in our bodies potentially cause disease.
- Toxic materials in the water can potentially affect human health by contaminating public water supplies.

Fish Consumption

In the last several years, advances in analytical capabilities and techniques and the generation of more frequent and higher quality toxicity information on chemicals have led to an increased concern about their presence in the aquatic environment and the associated effects on human health and other organisms. Many pollutants are likely to be found in fish tissue and bottom sediments at levels higher than in the water column. IDEM collected much of the data on toxic substances used for fish consumption assessments in this report through its Fish Tissue Contamination and Sediment Contaminants Monitoring Programs in the OWQ.

A number of studies have shown that contaminants of emerging concern are increasingly detected at low levels in surface water around the country. As a result, there is growing concern about the potential negative impacts that these compounds might have on aquatic life. Scientists do not yet fully understand the risk that emerging contaminants pose to human health and the environment. Many of these contaminants come from personal care products and pharmaceuticals. The U.S. EPA has also identified per-and polyfluoroalkyl substances (PFAS) as a group of contaminants of emerging concern. Due to their resistance to degradation, PFAS persist in the environment making them detectable at low concentrations.

In 2017, IDEM began analyzing fish tissue samples for 13 different PFAS in order to characterize their concentrations across the state. To date, IDEM has analyzed 66 sites for PFAS. Similar to observations in other states, perfluorooctane sulfonate (PFOS) is the primary PFAS compound that accumulates in fish tissue. IDEM found PFOS in 100 percent of samples analyzed, which accounts for 91% of the total PFAS in fish. IDEM will continue to monitor for these chemicals each year until the agency has sufficient data to determine current background conditions throughout the state, can determine potential sources, and develop a better understanding of the risks they pose to human health and the environment.

In 2016, the U.S. EPA published the final national chronic aquatic life criterion for selenium in fresh water. The criterion reflects the most current scientific knowledge, which indicates that selenium's toxicity to aquatic life occurs primarily through an organism consuming selenium-contaminated food rather than by being exposed to selenium dissolved in water (U.S. EPA, 2016). The criterion has two components based on the concentration of selenium in fish tissue (eggs and ovaries, and whole-body or muscle) and two components based on the concentration of selenium in the water-column (two 30-day chronic values and an intermittent value). IDEM has been collecting selenium in fish tissues since 2007 and currently has a dataset consisting of more than 2,300 records. In comparing these results to U.S. EPA's 2016 water quality criterion for selenium, IDEM has found that, generally, levels of selenium in Indiana wild and sport fish are not of concern. However, IDEM did find higher levels in some isolated waterbodies.

IDEM actively participates in the development of the Indiana Fish Consumption Advisory (FCA) by conducting the monitoring necessary for its development and actively participating in the Indiana Interagency FCA Work Group, whose mission is to:

- Maintain the health benefit of fish consumption.
- Minimize the potential for consumer toxic chemical exposure.
- Use credible and understandable science.
- Present information in a manner conductive to maximal voluntary compliance.

With this mission in mind, the work group has spent several years updating rules that guide the development of consumption advisories. Using this new guidance and better technology, the work group's 2018 update to the FCA contained major improvements, which included making advisories accessible through an interactive map application. IDEM's Contaminants Monitoring Program continues to target the fish found in Indiana's major river systems, known contaminated areas, waterbodies on

public properties, major reservoirs and natural lakes, waterbodies requested by other agencies or program areas, and a set of "core" stations that have been sampled since 1979. The Indiana FCA, information on the benefits of eating fish, recipes, information on contaminants, taxonomy guides, and the Statewide Safe Eating Guide is available on the Indiana State Department of Health (ISDH) website at: www.in.gov/isdh/23650.htm.

It is important to note that citizens with concerns related to risks associated with eating the fish that they catch from Indiana waters should always refer to the FCA. Neither this report nor the 303(d) list of impaired waters it contains are designed to provide public health information. The FCA is developed specifically for that purpose and is far more reliable for use in deciding the amount of fish that might safely be consumed from a given waterbody.

Cyanobacteria and Algal Toxins

Blue-green algae (cyanobacteria) continue to be a concern in Indiana lakes and reservoirs both with respect to recreational uses and to public water supplies for drinking water. Blue-green algae are natural and common constituents of algal communities in lakes. However, during optimal conditions for growth, many "bloom" to produce visible surface scums, flocculent colonies, or algal mats. Cyanobacteria in these conditions can produce potent toxins, known as "cyanotoxins", which are recognized as a potentially serious threat to human and animal health due to their role as neurotoxins, hepatotoxins, and/or dermatoxins.

In 2010, IDEM piloted a targeted monitoring effort to support the development of an interagency process for the development of public health advisories for blue green algae and algal toxins. IDEM monitored 14 swimming areas throughout the state that are owned or managed by the Indiana Department of Natural Resources (IDNR) on a monthly basis from May through August. IDEM increased its sampling frequency every other week for lakes where cyanobacteria densities exceeded 100,000 cells per milliliter, as recommended by the World Health Organization. When the two-year grant period for the pilot project ended, IDEM incorporated a blue-green algae monitoring program into its overall water monitoring strategy.

IDEM now conducts this monitoring routinely at 16 state-owned sites throughout the recreational season (April 1 through October 31). IDEM also conducts weekly sampling at the Ft. Harrison Dog Park Lake. IDEM scientists identify and count the number of cyanobacterial cells in each sample using microscopy, and determine the concentrations of Microcystin, Cylindrospermopsin, Anatoxin-a, and Saxitoxin in the laboratory. IDEM provides these results to IDNR, which issues a High Cell Count Advisory when cyanobacterial cell counts are 100,000 cells/mL or greater. IDNR issues toxin-based recreational advisories and beach closures if toxin concentrations are above certain threshold values (Table 24, Appendix A). These thresholds were developed based on guidance from the World Health Organization, the U.S. EPA, and the Ohio Environmental Protection Agency. Beginning with the 2020 sampling season, IDEM will be adding an additional four beach sites (at four unique lakes) to the sampling roster for a total of 20 sites, allowing for greater coverage of IDNR-operated State Recreational Area and State Park Beaches across the State.

The www.algae.IN.gov website and the IDNR site help to keep the public informed of the status of the swimming areas sampled at each property. The IDNR also posts test results to its social media pages, increasing engagement and awareness of hazards and advisories. IDEM's website incorporates public health information related to blue-green algae from the ISDH and the Board of Animal Health as well as other relevant information from government agencies and educational institutions. In addition, signs are posted at each swimming area as well as at the Ft. Harrison Dog Park Lake, displaying the current risk at each individual property.

IDEM does not use information collected through these monitoring programs to make 305(b) assessments due to the lack of understanding within the scientific community at large about the environmental factors that influence the occurrence and production of algal toxins and there are no federal drinking water standards for blue-green algae. U.S. EPA's Office of Water has listed cyanobacteria and cyanotoxins on its drinking water contaminant candidate list (CCL) for the first time in 1998. Moreover, in 2009, U.S. EPA specifically included Anatoxin-a, Cylindrospermopsin, and Microcystin-LR, on CCL 3 and again on CCL 4 in 2016. The U.S. EPA began CCL5 development in October 2018, and IDEM expects that algal toxins will remain an issue of concern. U.S. EPA uses CCLs to prioritize federal research and data collection efforts to help determine whether a specific contaminant warrants regulation. More information on U.S. EPA's CCL is available online at www.epa.gov/ccl.

In 2015, U.S. EPA developed Health Advisories for Cylindrospermopsin and Microcystin and updated them in 2019. IDEM anticipates that as more scientific information becomes available, including the development of federal water quality criteria for algal toxins, it may be possible to develop water quality assessment methods that will allow IDEM to determine the impact that algal toxins may be having on the designated uses of Indiana waters.

Fish Kills and Chemical or Other Spills

IDEM considers a diverse and healthy fish community an indication of good water quality. Dead and dying fish can create serious public concern when they are found in large numbers in Indiana waters because fish kills are sometimes evidence of a severe water quality problem. Fish kills also have the potential to impair the use of the waterbody in the short or long term. A fish kill can result from:

- An accidental or intentional spill of a toxic compound or oxygen-depleting substance into the aquatic environment.
- A continuous industrial or municipal discharge due to a system upset which can result in releases of atypical or unusually high concentrations of pollutants.
- Natural causes such as disease, extreme draught or depletion of dissolved oxygen from extreme weather conditions.

IDEM's Office of Land Quality tracks spills and fish kills reported to IDEM or discovered by agency staff members. Table 25 (Appendix A) shows the total number of phone calls IDEM received regarding possible environmental emergencies, chemical spills, and fish kills between 1998 and 2019.

GROUND WATER ASSESSMENT

In order to be eligible for Clean Water Act (CWA) Section 106 grant funds, Indiana is required to have the means to monitor water quality (and to annually update water quality data and include the results in their biennial IR to U.S. Environmental Protection Agency (EPA). While U.S. EPA's integrated reporting requirement pertains primarily to surface waters, U.S. EPA guidance suggests that state updates should also include ground water to the extent practicable. This section provides a summary of Indiana's ground water monitoring and protection programs, ground water/surface water interactions within Indiana, ground water quality, and ground water contamination sources.

Ground water is an important resource for Indiana citizens, agriculture, and industry. Much of Indiana's population relies on ground water for drinking water and other household uses. The Indiana Department of Environmental Management's (IDEM's) 2018 Annual Compliance Report for Indiana public water supply systems is online at:
https://www.in.gov/idem/cleanwater/files/dw_compliance_report_2018.pdf.

MAJOR SOURCES OF GROUND WATER CONTAMINATION

Table 26 (Appendix A) identifies the major contaminant sources affecting Indiana ground water which are listed by general activity types. All sources listed are a potential threat to ground water. The degree to which the source is a threat to ground water depends on several factors with the most significant being hydrogeologic sensitivity. Other major risk factors include location of the contaminant source relative to drinking water sources, the toxicity of the contaminant, and the size of the population at risk. All risk factors listed in Table 26 were considered in the selection of ten priority contaminant sources, and those risk factors relevant to the highest priorities are identified. Classes of contaminants commonly associated with each high priority contaminant source are also given. Due to resource constraints, IDEM has been unable to update this information since the 2000 305(b) report. However, anecdotal evidence indicates the same major contaminant sources are affecting Indiana ground water now as they were at that time.

Sources of Nitrate

Nitrate is a potential contaminant that can be introduced into the environment from a variety of sources, including commercial fertilizer and animal manure applications to farmland, and septic systems – all of which are considered high priority sources of potential contamination to Indiana ground water. Nitrate is a highly mobile and soluble contaminant and is most frequently detected in ground water in rural areas. However, determining the source of nitrates detected in ground water can be difficult and costly.

Fertilizers

When applied at the proper rate and time, commercial fertilizer poses little threat of contamination to ground water. Purdue University Cooperative Extension Service staff members, Natural Resource Conservation Service staff members, and private consultants assist crop producers in developing nutrient management plans that focus on meeting the nutrient needs of their crops using only the amount of fertilizer necessary.

On July 28, 2010, the state rule requiring certification for distributors and users of fertilizer materials (355 IAC 7-1-1) became effective, and the Office of the Indiana State Chemist (OISC) is responsible for its administration. A variety of agricultural groups and other stakeholders supported the rule, viewing the rulemaking as an opportunity for fertilizer material applicators and distributors to demonstrate their competency to handle and apply these materials safely and effectively. The rule indeed achieves this and in addition, provides a statewide standard for applicator certification and training.

The rule defines “fertilizer material” to mean both commercial fertilizer and manure from a confined feeding operation (CFO). Any person hired to apply, handle, or transport fertilizer material for purposes of producing an agricultural crop must be certified and licensed by OISC. Alternatively, he or she must be trained and supervised by a certified applicator, and be working for a licensed fertilizer business. Any person applying manure from a CFO (in excess of 10 cubic yards or 4,000 gallons per year) to his/her own property must be certified by OISC as a private fertilizer applicator. Any person, partnership, corporation, or business that distributes but does not use fertilizer material must obtain a fertilizer distributor business license.

Confined Feeding Operations

Livestock and poultry confined feeding operations (CFOs) exist throughout Indiana and are an integral component of Indiana’s agricultural economy. The primary concerns associated with CFOs are

the proper storage and land application of the large volumes of manure produced by these operations. Manure applied to farmland helps to recycle the nutrients in the soil to fertilize crops. However, manure contains ammonia-nitrogen, which is converted to nitrate through biological processes in the soil. Consequently, the rate of manure application to farmland is a major concern when the amount applied to the land provides more nitrogen than crops can use. Because excess nitrogen can move beyond the crop root zone and potentially into underlying aquifers, Indiana's current regulations for CFOs require the proper design and construction of manure storage structures and the application of manure to land in a manner that protects ground and surface water quality. Crop nutrients contained in manure are available at a slower rate than commercial fertilizer nutrients due to the rate of decomposition of the manure. Therefore, when applied at the proper agronomic rate, manure poses little threat of contamination to ground water.

Septic Systems

Properly constructed and maintained septic systems provide satisfactory on-site treatment of domestic wastewater in rural and unsewered suburban areas of Indiana. However, improperly constructed or poorly maintained septic systems, as well as systems operating in areas of high seasonal water tables or other ground water sensitive areas, are also of concern as a source of nitrate contamination to ground water.

Landfills and Underground Storage Tanks

Landfills and underground storage tanks are a high priority concern for ground water due to practices or activities that occurred prior to construction standards and legislation established for its protection. Landfills constructed after 1988 have been required to adhere to stringent construction standards. Since then, IDEM's Underground Storage Tank (UST) in its Office of Land Quality closely reviews all underground storage tank registrations, upgrades, closures, and site assessments.

IDEM has ensured that all regulated UST owners and operators properly registered, upgraded and/or closed existing UST systems in accordance with state requirements. Currently, IDEM inspects all USTs systems at least once every three years to ensure that systems are properly designed and operated for corrosion protection, spill and overfill protection, and leak detection in order to prevent releases or ensure early detection of any releases. IDEM also inspects UST systems that are no longer in use to ensure they are properly closed. In addition, IDEM ensures that all confirmed releases of petroleum and hazardous substances into the environment, including ground water, are cleaned up as necessary to protect human health.

Underground Injection Wells

Class V underground injection wells are widespread throughout the state and occur in high concentration in several areas, including some areas where ground water is highly sensitive to contamination. Most Class V wells are shallow wells used by businesses and individuals to dispose of a wide variety of non-hazardous fluids into the ground. The United States Environmental Protection Agency (U.S. EPA) regulates Class V wells because they can release a wide variety of waste fluids into the ground. Under current regulation, Class V wells may be used to dispose of non-hazardous fluids only. However, this was not always the case.

Prior to 2000, when the U.S. EPA passed more intensive rules and enforcement mechanisms for Class V wells, they were sometimes used to dispose of potentially hazardous fluids. These older wells create the potential for ground water contamination if the fluids they contain are hazardous and leach into or above aquifer supplying drinking water. The U.S. EPA regulates these wells directly through its Class V Underground Injection Control Program, which targets the wells that pose the greatest environmental

risk.

Industrial Activities

IDEM has documented several cases of ground water contamination due to industrial facilities or their ancillary operations in Indiana. Although many contamination events occurred prior to the development of regulations for the storage and handling of industrial materials, ground water contamination still occurs due to accidents and intentional dumping of waste. In 1998, Indiana's Secondary Containment of Above-Ground Storage Tanks Containing Hazardous Materials Rule (327 Indiana Administrative Code (IAC) 2-10) was adopted. This rule requires that new facilities provide secondary containment for storage of 660 gallons or more of hazardous wastes if the facility is located outside an approved delineated wellhead protection area. However, if the facility is located within a wellhead protection area, secondary containment is required for any tank storing 275 gallons or more of hazardous materials.

The secondary containment rule along with IDEM's outreach and education programs have helped to prevent further ground water contamination from the storage and handling of industrial materials. However, these activities continue to be a potential source of contamination to ground water in Indiana.

Road Salts

The storage and extensive use of salt as a deicing agent during the winter months has an impact on ground water, and IDEM has documented contamination from road salt in Indiana. The Indiana Department of Transportation (INDOT) is now building any new salt storage facilities only in areas where ground water is not sensitive to contamination and making efforts to upgrade existing facilities to protect ground water. Currently all INDOT salt storage facilities are covered by domes or canopies, and several new facilities have been built to contain all surface runoff on-site to reduce ground water contamination. In addition, INDOT and many local municipalities have been successful at reducing their road salt use and application rates over the past several years through computerized weather forecasting and roadway temperature sensors.

Spills

Ground water contamination resulting from spills can be avoided or minimized if they are reported promptly to IDEM's Spill Line, which helps to ensure that they are handled and cleaned up quickly and properly. Indiana havsa rule in place to help ensure that spills with the potential to contaminate ground water are reported in a timely manner and managed in a way that minimizes their impact (327 IAC 2-6.1).

GROUND WATER PROTECTION PROGRAMS

Programs that conduct monitoring to evaluate and protect ground water resources in Indiana occur at all levels of government. Several ground water protection programs and activities have been implemented or are in the process of being implemented at the state level. Table 27 (Appendix A) lists key ground water protection programs and activities in Indiana, developmental stage of the program or activity, and the agency or agencies responsible for the program's implementation and/or enforcement.

Classification of Indiana's Ground water Resources

Indiana's ground water quality standards became effective in March 2002. The language of the rule includes numeric standards that provide ground water protection to wells and allows for the classification of ground water. The rule states that all ground water of the state shall be classified as drinking water class ground water unless it is classified as limited class ground water or impaired drinking water class ground water. IDEM may classify ground water as limited when ground water is shown to have a yield of less than 200 gallons per day or a total dissolved solids concentration of more than 10,000 parts per million (ppm). Additionally, ground water that is in the crop root zone, in a coal mined area, or in an injection zone of a permitted Class I, II or III injection well or gas storage well may be considered limited. IDEM may classify ground water as impaired when specific conditions are met. These conditions include, but are not limited to:

- The ground water is not in a state approved wellhead protection area established pursuant to 327 Indiana Administrative Code (IAC) 8-4.1.
- The ground water has one or more contaminant concentrations above the numeric criteria established in the rule.
- The commissioner has approved a ground water remediation, closure, cleanup or corrective action plan that describes the nature and extent of contaminants exceeding the criteria.

Source Water Assessment Program

In 2000, U.S. EPA approved Indiana's Source Water Assessment Program, which was developed by IDEM in consultation with Indiana stakeholders. IDEM has prepared source water protection plans (SWAPs) for all public water systems that use surface water as their primary source of water. Additionally, systems that utilize ground water are required by the Indiana Wellhead Protection Rule (327 IAC 8.4.1) to prepare a wellhead protection plan for each well or well field that provides water to the public. Since 2000, source water areas for more than 3,600 public water systems have been delineated. The potential sources of contamination of these source water areas have been inventoried and IDEM has assessed water system susceptibility to contamination. By the end of 2008, IDEM had distributed susceptibility determinations for Indiana's public water systems to their owners. As a result, , IDEM's Source Water Assessment Program is completely implemented and satisfies the requirements of the Source Water Assessment Program as defined by IDEM and accepted by U.S. EPA.

The Indiana Wellhead Protection Rule (327 IAC 8-4.1) became effective in March 1997, which is implemented by IDEM's Wellhead Protection Program (part of IDEM's Source Water Assessment Program) to protect public water supplies from contamination. The Wellhead Protection Rule outlines the minimum requirements community public water supplies must meet to comply with the Indiana Wellhead Protection Rule. As of March 2020, close to 96 percent of Indiana's community water systems using ground water as their source of drinking water have an approved phase 1 wellhead protection plan with ongoing update efforts as required by the rule. Having an approved wellhead protection plan indicates that a community has met the requirements of the Indiana Wellhead Protection Rule and has developed strategies to protect their community water supplies from becoming contaminated.

Other Programs Working to Protect Indiana's Ground water Resources

In addition to regulatory programs and other structured ground water protection activities listed in Table 27 (Appendix A), there are several educational programs conducted in Indiana that place an emphasis on ground water protection. The Purdue University Extension Service's Safe Water for the Future Program serves as an umbrella program for several other programs that provide resources on drinking water protection for individuals and communities. The Farm*A*Syst and Home*A*Syst Programs are essentially wellhead protection programs for rural and domestic private wells. A series of

publications and brochures on wellhead protection are also available to assist communities working on wellhead protection. "Watershed Connections" brings together local contacts to produce a community specific publication on water resources and their protection.

The IDNR's Project WET (Water Education for Teachers) and Purdue University Extension Service's "Water Riches" Program are two general water education programs that provide information about ground water protection.

GROUND WATER MONITORING FOR PUBLIC WATER SUPPLIES

The Compliance Section of the Drinking Water Branch at IDEM receives ground water compliance monitoring results reported by public water systems for volatile organic compounds (VOCs), synthetic organic compounds (SOCs), inorganic compounds (IOCs), nitrates (NO_3), and radionuclides.

Radionuclide monitoring consists of analysis for gross alpha particle activity. Public water supply systems collect samples from various points within their system including after water is treated and before it enters the distribution system. Samples may be collected from a single well or blended from two or more wells. Other parameters monitored by public water systems depend on the type of system. There are three types of public water systems: community, non-transient non-community, and transient non-community. The three types of public water systems are defined below:

- A community system is defined as a system that serves water to the public and has at least 15 service connections used by year-round residents or regularly serves at least 25 year-round residents. Examples of community water systems are municipal systems, mobile home parks, nursing homes and homeowners associations. Along with regular bacteria sampling, community systems are required to test for thirty regulated SOCs, 21 VOCs, 12 regulated IOCs, sodium, and radionuclides. Sampling for these parameters is required a minimum of once every three years depending on the levels of contaminates detected. As of February 2020, there are 778 community systems in Indiana.
- A non-transient non-community water system is defined as a public water system that is not a community water system that regularly serves the same 25 or more persons at least six months per year. Examples of non-transient non-community water systems could include restaurants, factories, daycares and schools. Along with regular bacteria sampling, non-community non-transient systems are required to test for 30 regulated SOCs, 21 VOCs, 11 regulated IOCs (except sodium and fluoride), and radionuclides. Sampling for these parameters is required a minimum of once every three years depending on levels of contaminates detected. As of February 2020, there are 580 non-transient non-community systems in Indiana.
- A transient non-community is defined as a non-community water system that serves an average of 25 individuals at least 60 days per year. Examples of transient non-community water systems include restaurants, rest stops and gas stations. Along with regular bacteria sampling, transient non-community systems are required to test for radionuclides. As of February 2020, there are 2,677 transient non-community systems in Indiana.

Compliance monitoring results reported by public water systems are considered "treated water" and may not represent "source" or "raw water" results. The public can view the information public water systems report to IDEM through the Safe Drinking Water Information System at www.myweb.in.gov/IDEM/DWW/.

Statewide Ground water Monitoring Network

The Ground Water Section of the Drinking Water Branch manages a statewide ground water monitoring network (GWMN). The GWMN seeks to establish a statistical model of ambient ground water quality across the state to determine how to best protect source water and drinking water supplies and

evaluate ground water/surface water interactions. The GWMN employs the following strategy to meet these goals:

1. Collect ground water samples from public water supply (PWS) wells and private residential wells within distinct hydrogeologic areas of the state with the overall goal to determine the quality of ground water in the state's aquifers.
2. Identify and expand sampling in areas with notable contamination.
3. Practice continual improvement adjusting the GWMN as necessary to fit resource needs (monetary/field support) and gaps in the data.

IDEM has conducted sampling for the GWMN every year since 2006 when the network was established. Although IDEM has revisited many of the sampling sites over multiple sampling rounds, the number of sites sampled each year varies based on site suitability, participant interest, availability of resources, and previous sampling results.

Beginning in 2013, IDEM adjusted the design of the GWMN to provide more statistical power to the dataset by randomly selecting sites proportionally distributed across the state based on hydrogeologic settings. The Indiana Geological and Water Survey (IGWS) has divided the state into hydrogeologic settings to "provide a conceptual model to help interpret the occurrence, movement, and sensitivity to contamination of ground water in relation to … the surface and subsurface environment" (Fleming, 1995). The IGWS has identified more than 240 individual hydrogeologic settings across the state. For the purposes of developing the GWMN, IDEM scientists grouped these into 20 generalized settings that are common throughout Indiana.

Based on the 20 generalized hydrogeologic settings, IDEM determined that it needs approximately 398 samples to accurately represent ambient ground water quality across the state for each sampling round in the GWMN. These sampling sites were proportionally distributed throughout the 20 generalized hydrogeologic settings using a weighting procedure (known as stratified sampling) based on the percentage of located wells in that setting. The weighted number of samples in the generalized settings ranged from one to 154 samples. IDEM conducted three rounds of sampling (using unique sites in each sampling round) from May 2013 to November 2016. Figure 8 (Appendix B) shows the locations of the wells sampled during these rounds.

As a part of its implementation of the GWMN, IDEM Ground Water Section staff :

- Randomly selected sampling sites in each general hydrogeologic setting from a pool of residential well owners that volunteered to participate in the GWMN.
- Collected ground water samples from drinking water wells for analysis at IDEM's contract laboratories.
- Reviewed analytical sampling results.
- Distributed sampling results to GWMN participants.
- Developed a program report.

IDEM's Ground Water Section collected most samples from May to September. IDEM generally collects samples from outdoor spigots with untreated water or, in the case of public water supplies, from source water sample taps. IDEM analyzes these samples for more than 200 parameters, including alkalinity, anions/cations, metals, nitrogen as nitrate-nitrite (N+N), synthetic organic compounds, volatile organic compounds, and pesticide degradates.

Table 28 (Appendix A) shows summary statistics for the analytical parameters that were detected in the ground water samples collected during the three sampling rounds. Disinfection byproducts and plasticizers were not included in this analysis. If a particular analyte was not detected in the sample, IDEM did not include it in the table. Maximum Contaminant Levels (MCLs) Secondary Maximum Contaminant Levels (SMCLs), or Recommended Levels are provided where applicable.

For all samples collected during this study, analytes that had the most occurrences above a MCL included arsenic and nitrogen as nitrate-nitrite (hereafter referred to as simply "nitrogen"). Parameters for which there were occurrences above the SMCL or U.S. Environmental Protection Agency (U.S. EPA) Recommended Levels included iron, manganese, sodium, sulfate, and strontium. IDEM detected VOC contamination in several samples, including petroleum contamination (found in seven wells) and chlorinated solvents (found in three wells). Table 29 (Appendix A) shows the VOC contamination detected in the GWMN samples.

Summary Results for Nitrogen as Nitrate-Nitrite

During GWMN sampling, 330 samples (about 28 percent) contained detectable levels of Nitrogen. Nineteen of those samples exceeded the MCL of 10 milligrams per liter, and the highest reported concentration was 22 milligrams per liter (mg/L). The locations of the sites sampled for nitrogen are shown on an aquifer sensitivity map developed by Letsinger (2015) (Figure 9, Appendix B). In highly sensitive areas, surficial infiltration can rapidly recharge ground water, allowing potential contaminants (including nitrates and pesticides) found at the ground surface or shallow subsurface to be transported into the aquifer. Summary statistics were calculated for the nitrogen data for Indiana's generalized hydrogeologic settings (Table 30, Appendix A).

Average nitrogen concentrations for each hydrogeologic setting were also calculated for well type and depth, aquifer conditions, and aquifer sensitivity (Table 31, Appendix A). Higher nitrogen concentrations were generally found in shallow wells screened in unconsolidated material. Aquifers with "High" or "Very High" sensitivities also contained the highest average nitrogen concentrations. Oxidizing aquifers had significantly greater nitrogen levels and higher average concentrations than reducing aquifers. Previous studies (Freeze & Cherry, 1979) have shown that ground water redox conditions can influence the distribution and mobility of nitrogen within aquifers.

Summary Results for Arsenic

Arsenic is a naturally occurring element found primarily in rocks, soil, water, and plants in many areas of the United States, including Indiana. Natural events, such as infiltration of water, dissolution of minerals from clay, and erosion of rocks can release arsenic into water. Arsenic can also be released into the environment as a byproduct of industrial activities, such as wood preservation, mining, and smelting (IDEM, 2015).

In the most recent round of sampling, 517 samples (around 44 percent) contained detectable levels of arsenic. One hundred twenty seven of those samples (11 percent) contained arsenic concentrations above the MCL (10 micrograms per liter (ug/L)). The highest reported concentration was 130 ug/L. Figure 10 (Appendix B) shows the location of the arsenic samples by hydrogeologic setting. Table 32 (Appendix A) shows summary statistics for arsenic samples by hydrogeologic setting, and Table 33 (Appendix A) provides a comparison between settings.

Around 48 percent of samples from unconsolidated wells contained detectable levels of arsenic, compared to 36 percent of samples from bedrock wells. Approximately 13 percent of unconsolidated wells contained arsenic above the MCL, compared to 7 percent of bedrock samples. Unconsolidated wells had a higher average Arsenic concentration (4.77 µg/L) than bedrock wells (3.2 µg/L). Wells screened in the 50- to 100-foot and the 100- to 150-foot depths had the highest average concentrations of Arsenic and the highest percentage of samples exceeding the MCL.

Reducing aquifers (as determined by negative values for oxidation-reduction potential) had higher average Arsenic concentration (5.31 µg/L) than oxidizing aquifers (1.60 µg/L). Of the 127 samples, 123 exceeded the MCL for Arsenic were from reducing aquifers. Previous studies of glacial aquifers in the northern US (including Indiana) have shown that Arsenic concentrations are higher in aquifers under reducing conditions (Thomas, 2007).

Summary Results for Pesticides and Pesticide Degradates

IDEM found several pesticides in their parent form in samples collected for the GWMN. Pesticides detected include Alachlor (one sample at 0.3 ug/L), Atrazine (four samples, 0.1 ug/L max), Endrin (one sample at 0.02 ug/L), Lindane (two samples, 0.03 ug/L max), and Simazine (two samples, 0.15 ug/L max). None of these detections exceeded or approached the MCL for that compound.

IDEM also analyzed GWMN samples for breakdown products for several common agricultural herbicides. Many of the herbicides used in Indiana to control broadleaf and grassy weeds in corn and soybeans can produce one/more of the following substances as they break down in the environment into Ethanesulfonic Acids (ESA) or Oxanilic Acids (OA):

- Acetochlor ESA.
- Acetochlor OA.
- Alachlor ESA.
- Alachlor OA.
- Metolachlor ESA.
- Metolachlor OA.

These breakdown products – ESAs and OAs – are generally more water soluble and mobile than the parent herbicide. As a result, there is greater potential for these degradates to be found in ground water or surface water (Shoemaker, 2003). To date, there are no established MCLs or health recommendation for these pesticide degradates.

Detectable levels of these degradates were found in 205 of the GWMN samples (17.6 percent), with a highest reported concentration of 7.8 µg/L of Metolachlor ESA. Figures 11, 12, and 13 (Appendix B) show the GWMN pesticide degradate results for Acetochlor ESA and OA, Alachlor ESA and OA, and Metolachlor ESA OA, respectively. Of the 205 samples that contained detectable levels of pesticide degradates, 91 (43 percent) contained more than one type of degradate compound, and 98 of the samples (48 percent) were located in areas of high or very high hydrogeologic sensitivity. Only 36 of the samples (17.5 percent) were in low or very low sensitivity areas.

Additional Arsenic Studies

IDEM conducted additional investigation into the high levels of arsenic observed during the first three rounds of GWMN sampling in 2018. IDEM collected ground water samples from 215 of the sampling sites that previously contained an arsenic concentration of 5.0 ug/L or above so that the geochemical species of the arsenic could be determined. Trivalent arsenic (As III) is typically more mobile in ground water, more toxic, and harder to remove through conventional treatment than pentavalent arsenic (As V). The study showed that on average, around 80% of the dissolved arsenic in

Indiana ground water is in the form of As III. The study also showed that fluctuations in arsenic levels over time were common, with 56% of the samples showing higher levels of arsenic than in the previous sampling event.

In 2019, IDEM conducted a pilot study to evaluate the spatial variability of arsenic levels observed during the statewide sampling for the GWMN. For this study, IDEM collected samples from a neighborhood in Nappanee, Indiana (Elkhart County) with known arsenic contamination in ground water. The residents in this area rely on private water wells as their drinking water source, and most of the wells in the area had a water well log available in the Indiana Department of Natural Resources database. Samples collected from this area contained arsenic at concentrations ranging from 13 ug/L to 140 ug/L. This shows that arsenic levels are highly variable, even within a 30-acre area. IDEM plans to conduct some additional studies in 2020 to determine, if possible, the geological and geochemical conditions responsible for this variability.

APPENDIX A:

INTEGRATED REPORT TABLES

Table 1: Summary of use support by waterbody type.

Designated Use	Total Size[1]	Size Assessed	Percent Assessed	Size Fully Supporting	Size Not Supporting
Rivers and Streams (Miles)					
Full Body Contact (Recreational Use)	63,511	33,599	52.9%	9,204	24,395
Human Health and Wildlife (Fishable Use)	63,511	8,891	14.0%	3,326	5,565
Public Water Supply[2]	377	23	6.1%	23	0
Warm Water Aquatic Life (Aquatic Life Use)	63,511	36,814	58.0%	24,465	12,349
Lake Michigan Shoreline (Miles)					
Full Body Contact (Recreational Use)	67	67	100.0%	0	67
Human Health and Wildlife (Fishable Use)	67	67	100.0%	0	67
Public Water Supply[1]	35	35	100.0%	35	0
Warm Water Aquatic Life (Aquatic Life Use)	67	67	100.0%	63	4
Lake Michigan (Acres)					
Human Health and Wildlife (Fishable Use)	154,176	154,176	100%	0	154,176
Lakes and Reservoirs (Acres)					
Full Body Contact (Recreational Use)	129,547	39,790	30.7%	30,503	9,287
Human Health and Wildlife (Fishable Use)	129,547	80,300	62.0%	41,306	38,994
Public Water Supply[1]	28,680	16,871	58.8%	230	16,641
Warm Water Aquatic Life (Aquatic Life Use)	129,547	17,475	13.5%	5,919	11,556

Source: U.S. EPA Assessment, Total Maximum Daily Load (TMDL) Tracking and Implementation System (ATTAINS) Indiana data for the 2020 Integrated Report Cycle (Version: Organization Public Comment).

[1] Total size shown for rivers and streams differ from those shown in Table 2 due to different information sources (ATTAINS versus the Indiana Reach Index). IDEM is working to resolve these differences by the 2022 cycle.

[2] While all waterbodies in Indiana are designated for aquatic life and recreational uses, not all are designated for use as a public water supply. There are a total of 29,541 lake acres and 111 stream miles (including 35 miles of shoreline) designated for use as a public water supply in Indiana.

Table 2: Atlas information.

Description	Value	Units
Indiana population[1]	6,666,818	People
Indiana surface area[2]	36,291	Square Miles
Total miles of rivers and streams[3]	63,511	Miles
Number of lakes, reservoirs and ponds[4]	1,555	-
Total size of lakes, reservoirs, ponds[4]	130,500	Acres
Great Lakes[5]	154,176	Acres
Great Lakes shoreline[6]	67	Miles
Fresh water wetlands[7]	913,999	Acres

[2]Indiana Department of Administration State Information Center.

[3]Indiana High Resolution Reach Index (Version 20190129). This value has been adjusted up from 62,612 miles to account for waters that are not yet indexed but which are tracked in U.S. EPA's Assessment, Total Maximum Daily Load (TMDL) Tracking and Implementation System (ATTAINS).

[4]U.S. EPA ATTAINS data for Indiana's 2020 Integrated Report Cycle (Version: Organization Public Comment). Note this value may include both publicly owned and private lakes, reservoirs and ponds in addition to those that are publicly owned.

[5]U.S. EPA Total Waters Estimates for United States Streams and Lakes (1993).

[6]Indiana High Resolution Reach Index (Version 20190129).

[7]Calculated value based on data derived from the National Wetlands Inventory of the U.S. Fish & Wildlife Service (USFWS) obtained from the GIO.wetlands_NWI_USFWS_IN geospatial data layer. Data are current as of May, 2014. Calculation includes wetlands classified as: Freshwater Emergent, Freshwater Forested/Shrub, Riverine, and "Other". Wetlands classified in the data set as Ponds or Lakes were not included.

Table 3: Clean Water Act Sections 205(j) and 319(h) investments for state fiscal years (SFY) 2003-2019. Table does not include an additional $434,328 from the American Recovery and Reinvestment Act of 2009, which was awarded through the State Revolving Fund (SRF) Program.

205(j)			319(h)		
FFY	Number of Projects	Amount Awarded	FFY	Number of Projects	Amount Awarded
2003	6	$507,054	2003*	34	$4,544,480

Pendleton Branch	050902030902	22	E. coli, impaired biotic communities	2018
South Fork Wildcat Creek	051201070400	5.48	Impaired biotic communities	2020
Boyles Ditch	051201070400	5.59	Impaired biotic communities	2020

*From 2003-2018, U.S. EPA used Measure SP-12 (commonly called “Measure W”) to track improvements in water quality conditions in impaired watersheds resulting from watershed planning and restoration activities. For the purposes of meeting this measure, improvements were demonstrated by the removal of at least 40 percent of the impairments or impaired miles/acres in the watershed from the state’s 303(d) List of Impaired Waters or by valid scientific information that indicates significant watershed-wide improvement in one or more water quality parameters associated with the impairments listed on Indiana’s 2002 303(d) list.

Table 6: State Revolving Fund (SRF) investments in state fiscal years (SFY) 2018 and 2019.

SRF Program	Number of Projects	Loan Amount	Savings Realized
Clean Water	62	$678,793,292	$137,198,575
Drinking Water	27	$214,132,778	$42,183,768

Source: SRF program tracking database

Table 7. BMPs implemented in the Southfork Wildcat Creek Watershed

Practice Type	Amount Implemented

Table 8: OWQ's primary and secondary water quality monitoring objectives and the types of monitoring approaches – Targeted (T), Probabilistic (P), and/or Fixed Station (F) – needed to meet them.

Key	Monitoring Objective	Priority	Monitoring Approach			Priority Rationale
			P	T	F	
A	Conduct water quality assessments pursuant to CWA Section 305(b) to support the development of Indiana's Integrated Report to U.S. EPA	Primary	X	X	X	Required for CWA Section 106 funding
B	Development of Indiana's CWA Section 303(d) List of Impaired Waters for Indiana's Integrated Report	Primary	X	X	X	Required for CWA Section 106 funding
C	Develop Total Maximum Daily Loads to address impairments identified on Indiana's 303(d) list	Primary	X	X	X	Required for CWA Section 106 funding
D	Determine trends and trophic status of Indiana's lakes and reservoirs under CWA Section 314	Primary	X	X		Required for CWA Section 106 funding
E	Develop water quality criteria, including nutrient criteria for lakes and reservoirs, rivers and streams	Primary	X	X		Required for CWA Section 106 funding
F	Support watershed planning and restoration efforts	Primary	X	X	X	Required for CWA Section 319 funding and to meet performance measures in U.S. EPA's Strategic Plan
G	Identify water quality improvements accomplished by watershed restoration efforts funded through CWA programs	Primary	X	X	X	Required to meet performance measures in U.S. EPA's Strategic Plan
H	Support the development of public health advisories related to the use of Indiana's water resources, including fish consumption advisories and recreational use advisories	Primary		X		Supports protection of human health
I	Determine ambient groundwater quality and extent of contaminated areas	Primary		X		Supports protection of human health

Table 9: Individual use support summary for Indiana streams.

Designated Uses					
Designated Use	Total Size (Miles)	Size Assessed (Miles)	Percent Assessed	Size Fully Supporting (Miles)	Size Not Supporting (Miles)
Full Body Contact (Recreational Use)	63,511	33,599	52.9%	9,204	24,395
Human Health and Wildlife (Fishable Use)	63,511	8,891	14.0%	3,326	5,565
Public Water Supply	377	23	6.1%	23	0
Warm Water Aquatic Life (Aquatic Life Use)	63,511	36,814	58.0%	24,465	12,349

Table 21: Lake classification scheme for Indiana.

TSI (CHL)	TSI (CHL)	Corresponding CHL values (ug/L)	Characteristics of Trophic State
Oligotrophic	Greater than 40	Less than 0.95-2.6	• Low biological productivity • High transparency (clear water) • Low levels of nutrients • Low algal production and little/no aquatic vegetation • Well oxygenated hypolimnion year round; hypolimnion of shallower lakes may become anoxic at TSI scores >30
Mesotrophic	40-50*	2.6-7.3	• Moderate biological productivity • Moderate transparency (moderately clear water) • Moderate levels of nutrients • Beds of submerged aquatic plants • Increasing possibility of anoxia in the hypolimnion during summer
Eutrophic	50-70	7.3-56	• High biological productivity • Water has low transparency • High level sof nutrients • Large amounts of aquatic plants or algae • At TSI scores >60, blue-green algae dominate and algal scums and excessive macrophytes possible • Hypolimnion commonly anoxic; fish kills possible
Hypereutrophic	Greater than 70	56-155	• Very high biological productivity • Very low transparency, usually <3 feet • Very high levels of nutrients • Dense algae and aquatic vegetation; algal scums and few aquatic plants at TSI scores >80 • Fish kills and/or dead zones below the surface are common • Hypolimnion persistently anoxic; Fish kills and/or “dead zones” below the surface common

*Lakes with a TSI score of 50, which is on the boundary between mesotrophic and eutrophic conditions are evaluated with their corresponding TSI scores for TP and SD along with any other available information and classified in accordance to the best professional judgment of IDEM scientists.

Table 22: Trophic status of lakes assessed with Carlson Trophic State Index scores for Chlorophyll *a* 1990-2015.

Trophic Status	Number of Lakes	Total Size (Acres)*
Oligotrophic	95	19,000
Mesotrophic	130	24,061
Eutrophic	202	50,205
Hypereutrophic	28	5,267
Unknown	17	2,404

*Actual values are higher. These results do not reflect acres for non-indexed lakes for which size is currently unknown.

Urban runoff		A, C, H, I	1, 2, 4, 5, 7, 8, 9

Sources: U.S. EPA 2006a; 2007

*Factors considered in selecting the contaminant source: (A) human health and/or environmental risk (toxicity); (B) size of the population at risk; (C) location of source relative to drinking water source; (D) number and/or size of contaminant sources; (E) hydrogeologic sensitivity; (F) documented state findings, other findings; (G) high to very high priority in localized areas, but not over majority of Indiana; (H) geographic distribution/occurrence; and, (I) lack of information.

**Classes of contaminants associated with contamination source: (1) Inorganic pesticides; (2) Organic pesticides; (3) Halogenated solvents; (4) Petroleum compounds; (5) Nitrate; (6) Salinity/brine; (7) Metals; (8) Radionuclides; and, (9) Bacteria, protozoa and viruses.

Table 7: Groundwater protection programs and activities currently established or under development in Indiana.

Program or Activity	Status	State Agency/Organization
Active SARA Title III Program	Fully established	IDEM-OLQ[1]
Ambient groundwater monitoring program	Fully established	IDEM-OWQ
Aquifer sensitivity assessment	Fully established	IDEM-OWQ, IDNR, IGS[2], OISC[3]
Aquifer mapping/basin studies	Under development	IDNR, IDEM-OWQ
Aquifer/ hydrogeologic setting characterization	Fully established	IGS, IDEM-OWQ, IDNR
Bulk storage program for agricultural chemicals	Fully established	OISC
Comprehensive data management system	Under development	IDEM-OWQ
Complaint response program for private wells	Fully established	IDEM-OWQ
Confined animal feeding program	Fully established	IDEM-OWQ
Groundwater discharge permits for constructed wetlands	Under development	IDEM-OWQ
Groundwater Best Management Practices	Under development	OISC*, IDEM-OWQ
Groundwater legislation	Fully established	IDEM, IDNR, OISC, ISDH
Groundwater classification	Fully established	IDEM-OWQ
Groundwater quality standards	Fully established	IDEM-OWQ
Land application of domestic and industrial residuals	Fully established	IDEM-OLQ
Nonpoint source controls	Under development	IDEM-OWQ
Oil and Gas	Fully established	IDNR
Pesticide State Management Plan	Pending	OISC*, IDEM-OWQ, IDNR, IGS
Pollution Prevention Program	Fully established	IDEM-OPPTA[4]
Reclamation	Fully established	IDNR
Resource Conservation and Recovery Act (RCRA) Primacy	Fully established	IDEM-OLQ
Sensitivity assessment for drinking water/ wellhead protection	Fully established	IGS, IDEM-OWQ

Program or Activity	Status	State Agency/Organization
Spill Monitoring	Fully established	IDEM-OWQ
State Superfund	Fully established	IDEM-OLQ
State RCRA Program incorporating more stringent requirements than RCRA primacy	Fully established	IDEM-OLQ
State septic system regulations	Fully established	ISDH
Underground storage tank installation requirements	Fully established	IDEM-OLQ
Underground Storage Tank Remediation Fund	Fully established	IDEM-OLQ
Underground Storage Tank Permit Program	Fully established	IDEM-OLQ
Underground Injection Control Program	Fully established for Class II wells	IDNR
Well abandonment regulations	Fully established	IDNR
Wellhead Protection Program	Fully established	IDEM-OWQ
Well installation regulations	Fully established	IDNR

*Indicates lead agency involved in enforcement or implementation.
Notes: “Pending” is used to describe those programs that have a written draft policy; “under development” is used to describe those programs still in the planning stage.

Table 8: Indiana Groundwater Monitoring Network analytical results, 2013-2016. Maximum Contaminant Levels (MCL) are standards that represent a legally enforceable threshold limit on the amount of a substance allowed in public water systems under the Safe Drinking Water Act. Secondary Maximum Contaminant Levels (SMCLs) are non-enforceable, secondary standards set to provide threshold limits for the levels of other substances that do not pose a risk to public health but can cause cosmetic effects (such as skin or tooth discoloration) or aesthetic effects (such as taste, odor, or color) in public water supplies.

*ND = Nondetect, meaning the result was below the detection limit of the analytical method. For analytes that were non-detect, a value of one half the detection limit was substituted for calculation of the summary statistics.
**NA = No MCL has been set for this substance.
Notes: Summary statistics were not calculated for volatile organic compounds (VOCs) detected during this study because they are associated with point sources and few were detected. A complete list of VOCs detected during sampling in shown in Table 31. Disinfection Byproducts and plasticizers have been omitted from this list until further analysis and sampling can be conducted to determine their sources.

Table 9: Detected volatile organic compounds in all Groundwater Monitoring Network samples. Maximum Contaminant Levels (MCL) are standards that represent a legally enforceable threshold limit on the amount of a substance allowed in public water systems under the Safe Drinking Water Act.

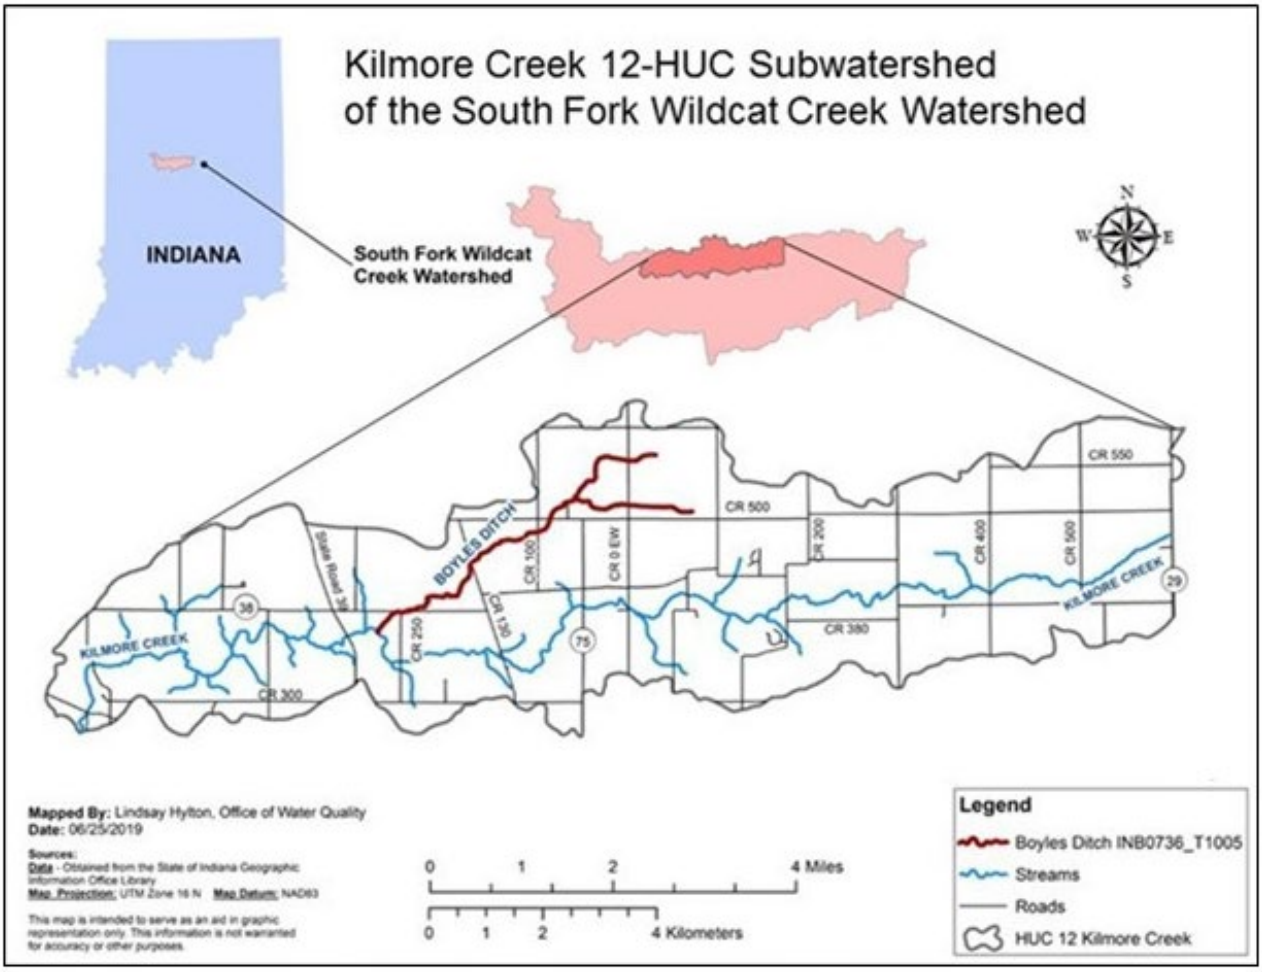

Figure 6. IDEM's nine-year rotating basin monitoring schedule for 2011-2019.

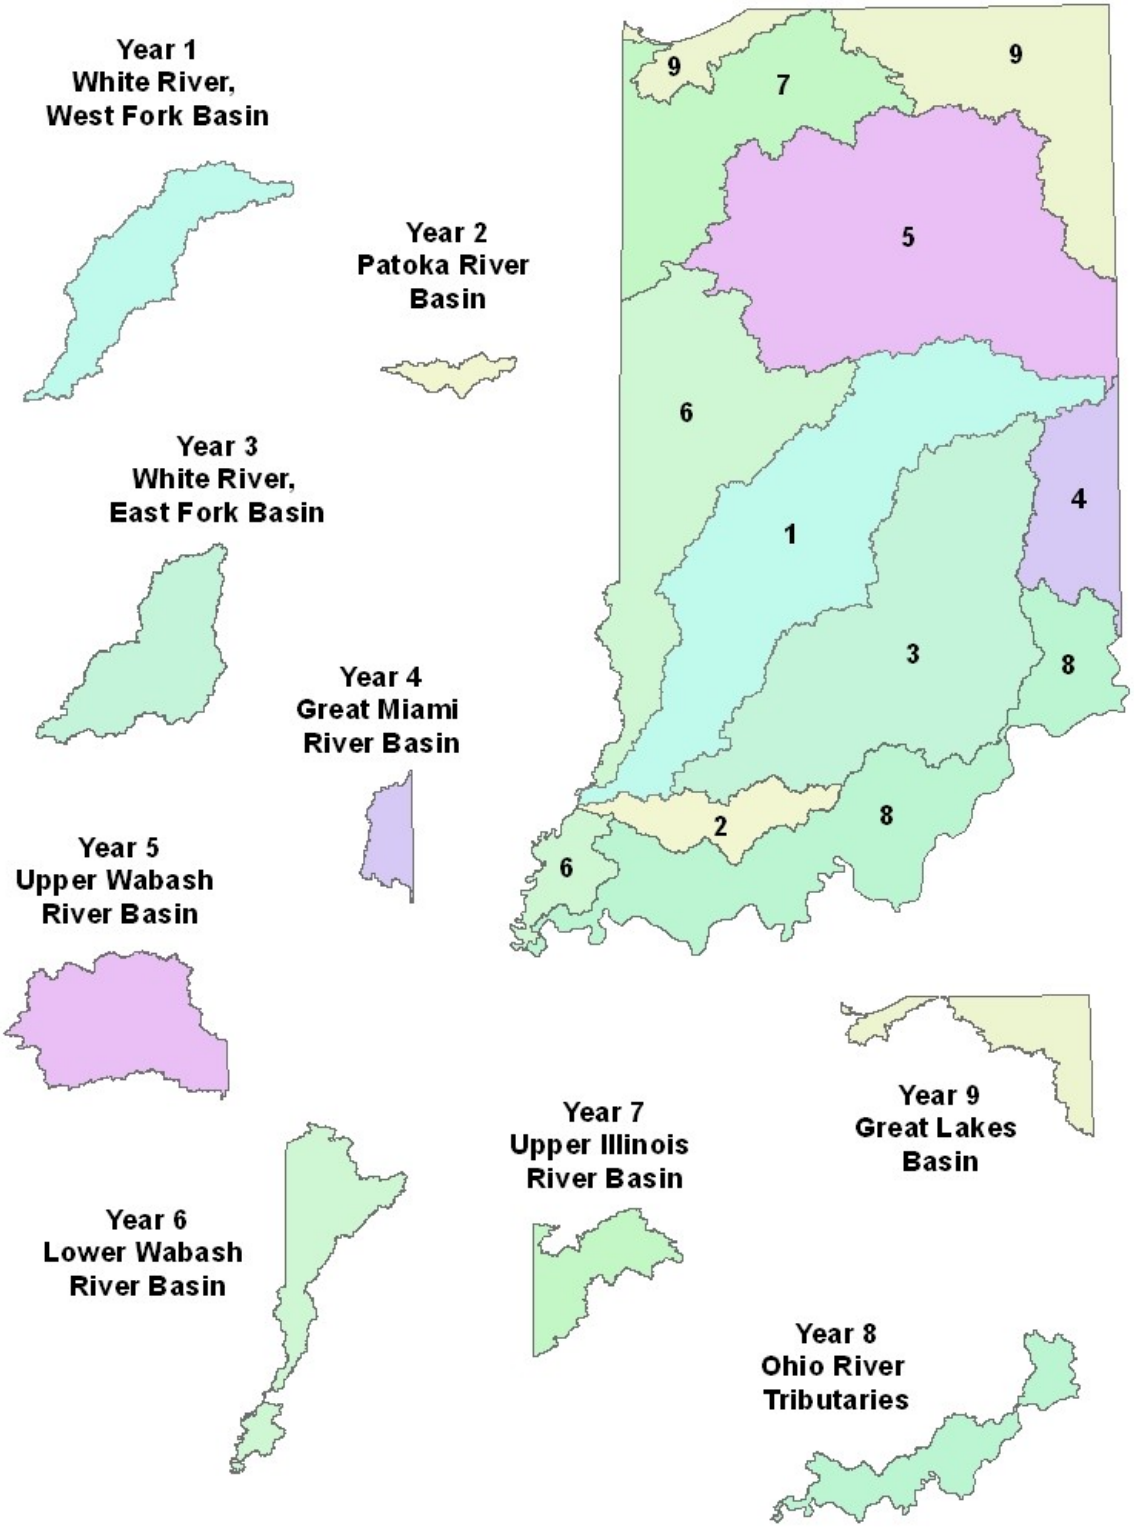

Figure 7: Decision-making process for determining Consolidated List categories for Indiana waters.

Water quality assessments and Consolidated Listing decisions are made for each beneficial use designated in Indiana's water quality standards (WQS). Assessments for each beneficial use are made by comparing the available data against the applicable narrative and numeric criteria expressed in the WQS. Waterbody assessment units (AU) are then placed in the appropriate category of Indiana's Consolidated List for the beneficial use assessed as shown below. A waterbody AU may appear in different categories depending on the information available for a given beneficial use.

Fax: 317-308-3219
Email: jarthur@idem.in.gov

IDEM uses U.S. EPA's Assessment and Total Maximum Daily Load (TMDL) Tracking and Implementation System (ATTAINS) to store and manage its water quality assessment information including its Clean Water Act (CWA) Sections 305(b) assessments, 303(d) listing decisions, and 314 trend and trophic data for Indiana lakes.

This metadata document contains a list of all files included in IDEM's 2020 Integrated Report and the information necessary to understand the cause and source information in the Integrated Report tables and other information provided in the report.

Table 1: Files included with Indiana's 2020 Integrated Report submittal.

File Name	Description
IR2020_Narrative.pdf	Adobe Acrobat file containing the narrative portion of Indiana's 2018 Integrated Report.
IR2020_AppA_Tables.pdf	Adobe Acrobat file containing the tables for the 2020 Integrated Report.
IR2020_AppB_Figures.pdf	Adobe Acrobat file containing figures for the 2020 Integrated Report.
IR2020_AppC_Metadata.pdf	Adobe Acrobat file containing filenames of all attachments and appendices and metadata needed to translate information used in ATTAINS.
IR2020_AppD_Status ofCat4Waters.pdf	Adobe Acrobat file containing information regarding impairment status of Category 4 waters.
IR2020_AppE_TMDLPriorities.pdf	Adobe Acrobat file containing IDEM's TMDL 2020-2022 development priorities.
IR2020_AppF_MARLschedule.pdf	Adobe Acrobat file containing IDEM's CWA Sections 305(b) and 303(d) water quality monitoring, assessment, reporting, and listing (MARL) schedule
IR2020_AppG_CALM_COVER.pdf	Adobe Acrobat file containing the title page for Appendix G.
IR2020_AppG_CALM.pdf	Adobe Acrobat file containing IDEM's Consolidated Assessment and Listing Methology for the 2020 cycle.
IR2020_AppH_CompALUS&RECR.pdf	Adobe Acrobat file containing IDEM's comprehensive statewide water quality assessments based on probabilistic monitoring results.
IR2020_AppI_ Trend&TrophicStatus.pdf	Adobe Acrobat file containing IDEM's Clean Water Act Section 314 assessments of lake trends and tropic state.
IR2020_AppJ_303dNOC_NarrativeOnly_COVER.pdf	Adobe Acrobat file containing the title page for Appendix J.
IR2020_AppJ_303dNOC_NarrativeOnly.pdf	Adobe Acrobat file containing the narrative portion of the public notice for the draft 2020 303(d) list. Supporting attachments are available online at: www.in.gov/idem/nps/2647.htm or by request from the Database Manager.
IR2020_AppK1_RTC_COVER.pdf	Adobe Acrobat file containing the title page for Appendix K.
IR2020_AppK1_RTC.pdf	Adobe Acrobat file containing IDEM's response to U.S. EPA narrative comments on the draft 2020 303(d) list.
IR2020_AppK2_RTC.xlsx	MS Excel file containing IDEM's response to U.S. EPA comments on the draft 2020 303(d) list provided to IDEM in spreadsheet format.
IR2020_AppL_ListingTables_COVER.xlsx	Adobe Acrobat file containing the title page for Appendix L.

File Name	Description
IR2020_AppL_ListingTables_FINAL.xlsx	MS Excel file containing tables to support Indiana's finalized 303(d) listing, including the finalized 303(d) list, Category 4 waters, and all changes made for the 202 cycle.
IR2020_AppM_ConsolidatedList_COVER.PDF	Adobe Acrobat file containing the title page for Appendix M.
IR2020_AppM_ConsolidatedList.xlsx	MS Excel file containing Indiana's 2020 Consolidated List (Categories 1-5).

Table 2: Uses in ATTAINS that represent those designated and other uses for which IDEM makes water quality assessments.

ATTAINS Use Name	IDEM Definition
Full Body Contact	Applies to Recreational Use assessments (Human Health or Aesthetics) of all waters outside the Great Lakes Basin (327 IAC 3-1-3(a)(1)).
Warm Water Aquatic Life	Applies to Aquatic Life Use assessments of warm waters outside the Great Lakes Basin (327 IAC 3-1-3(a)(2)).
Salmonid Waters	Applies to Aquatic Life Use assessments of waters outside the Great Lakes Basin designated by Indiana Department of Natural Resources for put-and-take trout fishing (327 IAC 3-1-3(c)(1)).
Human Health and Wildlife	Applies to Fish Consumption Use assessments of waters outside the Great Lakes Basin conducted pursuant to the water quality goals identified in 327 IAC 2-1-1.5.
Public Water Supply	Applies to Public Water Supply Use assessments of surface waters outside the Great Lakes Basin used as source waters for public water supply (327 IAC 3-1-3(a)(3)) and surface waters found to have a direct influence on a public water supply well (see IDEM's Consolidated Assessment and Listing Methodology).
Limited Use	Applies to waters within the Great Lakes Basin designated for Limited Use (the inability to fully support aquatic life) in 327 IAC 2-1-11(a) and/or designated for CSO wet weather limited use (an amended recreational use designation) in 327 IAC 2-1-11.5(a).
Great Lakes Full Body Contact	Applies to Recreational Use assessments (Human Health or Aesthetics) of all waters within the Great Lakes Basin (327 IAC 2-1.5-5(a)(1)).
Great Lakes Warm Water Aquatic Life	Applies to Aquatic Life Use assessments of warm waters within the Great Lakes Basin (327 IAC 2-1.5-5(a)(2)).
Great Lakes Salmonid Waters	Applies to Aquatic Life Use assessments of waters within the Great Lakes Basin designated as salmonid waters in 327 IAC 2-1.5-5(a)(3).
Great Lakes Human Health and Wildlife	Applies to Fish Consumption Use assessments of waters within the Great Lakes Basin conducted pursuant to the water quality goals identified in 327 IAC 2-1.5-3.
Great Lakes Public Water Supply	Applies to Public Water Supply Use assessments of source waters within the Great Lakes Basin (327 IAC 2-1.5-5(a)(4)) and surface waters found to have a direct influence on a public water supply well (see IDEM's Consolidated Assessment and Listing Methodology).
Great Lakes Limited Use	Applies to assessments of waters within the Great Lakes Basin designated for Limited Use (the inability to fully support aquatic life) in 327 IAC 2-1.5-19(a) and/or CSO wet weather limited use (an amended recreational use designation) pursuant to 327 IAC 2-1-3.1.
Full Body Contact	Applies to Recreational Use assessments (Human Health or Aesthetics) of all waters outside the Great Lakes Basin (327 IAC 3-1-3(a)(1)).
Warm Water Aquatic Life	Applies to Aquatic Life Use assessments of warm waters outside the Great Lakes Basin (327 IAC 3-1-3(a)(2)).
Salmonid Waters	Applies to Aquatic Life Use assessments of waters outside the Great Lakes Basin designated by Indiana Department of Natural Resources for put-and-take trout fishing (327 IAC 3-1-3(c)(1)).

ATTAINS Use Name	IDEM Definition
Human Health and Wildlife	Applies to Fish Consumption Use assessments of waters outside the Great Lakes Basin conducted pursuant to the water quality goals identified in 327 IAC 2-1-1.5.
Public Water Supply	Applies to Public Water Supply Use assessments of surface waters outside the Great Lakes Basin used as source waters for public water supply (327 IAC 3-1-3(a)(3)) and surface waters found to have a direct influence on a public water supply well (see IDEM's Consolidated Assessment and Listing Methodology).

Table 3: ATTAINS parameters IDEM may use to describe impairments to Indiana waters and the uses to which they apply (aquatic life use includes warm water aquatic life uses and salmonid waters). Not all of these parameters are currently in use in Indiana's data set. Rather, this list represents the subset of all parameters available in ATTAINS that Indiana might use.

ATTAINS Parameter Name	IDEM Definition	Applicable Uses			
		Full Body Contact	Aquatic Life Use	Public Water Supply	Human Health & Wildlife
ACROLEIN	Concentration of Acrolein exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
ACRYLONITRILE	Concentration of Acrylonitrile exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
ALDRIN	Concentration of Aldrin exceeds Indiana water quality standards for aquatic life use anywhere in the state (327 IAC 2-1-6 or 327 IAC 2-1.5-8) and/or for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	YES	YES	NO
AMMONIA NITROGEN	Concentration of Ammonia Nitrogen exceeds Indiana's water quality standards for aquatic life use (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	YES	NO	NO
ANTIMONY	Concentration of Total Antimony exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO

ATTAINS Parameter Name	IDEM Definition	Applicable Uses			
		Full Body Contact	Aquatic Life Use	Public Water Supply	Human Health & Wildlife
ARSENIC, TRIVALENT	Concentration of Dissolved Trivalent Arsenic (Arsenic III) exceeds Indiana's water quality standards for aquatic life use support anywhere in the state (327 IAC 2-1-6 or 327 2-1.5-8) and/or concentration of Total Trivalent Arsenic (Arsenic III) exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	YES	YES	NO
BARIUM	Concentration of Total Barium exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
BENZENE	Concentration of Benzene exceeds Indiana's water quality standards for public water supply in source waters (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	NO	YES	NO
BENZIDINE	Concentration of Benzidine exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
BERYLLIUM	Concentration of Total Beryllium exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6(a)).	NO	NO	YES	NO
BIOLOGICAL INTEGRITY	The benthic macroinvertebrate and/or fish communities indicate an impairment of aquatic life use based on the assessment methods provided in IDEM's Consolidated Assessment and Listing Methodology (CALM).	NO	YES	NO	NO
BIS-2-CHLOROETHYL ETHER	Concentration of Bis (2-chloroethyl) Ether (also known as Dichloroethyl Ether) exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO

ATTAINS Parameter Name	IDEM Definition	Applicable Uses			
		Full Body Contact	Aquatic Life Use	Public Water Supply	Human Health & Wildlife
CADMIUM	Concentration of Dissolved Cadmium exceeds Indiana's water quality standards for aquatic life use support anywhere in the state (327 IAC 2-1-6 or 327 2-1.5-8) and/or concentration of Total Cadmium exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	YES	YES	NO
CARBON TETRACHLORIDE	Concentration of Carbon Tetrachloride exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
CHLORDANE	Concentration of Total Chlordane exceeds Indiana water quality standards for public water supply in source waters anywhere in the state (327 IAC 2-1-6 or 327 IAC 2-1.5-8) and/or for aquatic life use in waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	YES	YES	NO
CHLORIDE	Concentration of Total Chloride exceeds Indiana water quality standards for aquatic life use and/or public water supply (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	YES	YES	NO
CHLORINE, RESIDUAL (CHLORINE DEMAND)	Concentration of Intermittent Total Residual Chlorine exceeds Indiana's water quality standards for aquatic life use (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	YES	NO	NO
CHLOROBENZENE (MONO)	Concentration of Chlorobenzene (also known as Monochlorobenzene) exceeds Indiana's water quality standards for public water supply in source waters (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	NO	YES	NO
CHLOROFORM	Concentration of Chloroform exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO

ATTAINS Parameter Name	IDEM Definition	Applicable Uses			
		Full Body Contact	Aquatic Life Use	Public Water Supply	Human Health & Wildlife
CHLORPYRIFOS	Concentration of Chloropyrifos exceeds Indiana water quality standards for aquatic life use in waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	YES	NO	NO
CHROMIUM, HEXAVALENT	Concentration of Dissolved Hexavalent Chromium (Chromium VI) exceeds Indiana's water quality standards for aquatic life use support (327 IAC 2-1-6 or 327 IAC 2-1.5-8) and/or concentration of Total Hexavalent Chromium (Chromium VI) exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	YES	YES	NO
CHROMIUM, TRIVALENT	Concentration of Dissolved Trivalent Chromium (Chromium III) exceeds Indiana's water quality standards for aquatic life use support and/or concentration of Total Trivalent Chromium (Chromium III) exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6(a)).	NO	YES	YES	NO
COPPER, DISSOLVED	Concentration of Dissolved Copper exceeds Indiana's water quality standards for aquatic life use support (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	YES	NO	NO
CYANIDE	Concentration of Total Cyanide exceeds Indiana water quality standards for public water supply (327 IAC 2-1-6 or 327 IAC 2-1.5-8) and/or concentration of either or both Chlorine Amenable Cyanide and Free Cyanide (also known as Weak Acid Dissociable) exceed Indiana's water quality standards for aquatic life use (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	YES	YES	NO
DDT (Dichlorodiphenyl-trichloroethane)	Concentration of Dichlorodiphenyltrichloroethane (DDT) exceeds Indiana water quality standards for public water supply in source waters (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	NO	YES	NO

ATTAINS Parameter Name	IDEM Definition	Applicable Uses			
		Full Body Contact	Aquatic Life Use	Public Water Supply	Human Health & Wildlife
DIBUTYL PHTHALATE	Concentration of Dibutyl Phthalate exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
DICHLOROBENZENE (MIXED ISOMERS)	Concentration of Dichlorobenzenes (all isomers) exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
DIELDRIN	Concentration of Dieldrin exceeds Indiana's water quality standards for aquatic life use support and/or for public water supply (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	NO	YES	NO
DIMETHYL PHTHALATE	Concentration of Dimethyl Phthalate exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
DIOXIN (INCLUDING 2,3,7,8-TCDD)	Concentration of Dioxin (including 2,3,7,8-TCDD) exceeds Indiana's water quality standards for public water supply (327 IAC 2-1-6 or 327 IAC 2-1.5-8) or the concentration exceeds the Ohio River Valley Sanitation Commission (ORSANCO) Pollution Control Standards (PCS) for fish consumption for the Ohio River.	NO	NO	YES	YES
DISSOLVED OXYGEN	Dissolved Oxygen concentration exceeds Indiana's water quality standards for aquatic life use (327 IAC 2-1-6 or 327 IAC 2-1.5-8) or the Ohio River Valley Sanitation Commission (ORSANCO) Pollution Control Standards (PCS) for aquatic life use in the Ohio River.	NO	YES	NO	NO
ENDOSULFAN	Concentration of Endosulfan (Hexachlorocyclopentadiene) (sum of all isomers) exceeds Indiana water quality standards for public water supply and/or aquatic life use in waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	YES	YES	NO

ATTAINS Parameter Name	IDEM Definition	Applicable Uses			
		Full Body Contact	Aquatic Life Use	Public Water Supply	Human Health & Wildlife
ENDRIN	Concentration of Endrin exceeds Indiana water quality standards for aquatic life use anywhere in the state (327 IAC 2-1-6 or 327 IAC 2-1.5-8) and/or for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	YES	YES	NO
ESCHERICHIA COLI (E. COLI)	Concentration of Escherichia Coli (E. Coli) bacteria exceed the levels identified in IDEM's Consolidated Assessment and Listing Methodology (CALM) for recreational use assessments.	YES	NO	NO	NO
ETHYLBENZENE	Concentration of Ethylbenzene exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
FLUORANTHENE	Concentration of Fluoranthene exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
FLUORIDE	Concentraton of Fluoride exceeds Indiana water quality standards for aquatIc life use anywhere in the state (327 IAC 2-1-6 or 327 IAC 2-1.5-8) and/or for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	YES	YES	NO
HARMFUL ALGAL BLOOMS	Concentration of Cylindrospermospsin and/or Microcystin-LR in source waters exceed the benchmarks provided in Indiana's Consolidated Assessment and Listing Methodology (CALM) for water quality asseessments of public water supply.	NO	NO	YES	NO
HEPTACHLOR	Concentration of Heptachlor exceeds Indiana water quality standards for aquatic life use and/or for public water supply in waters outside the Great Lakes Basin (327 IAC 2-1-6); Does not apply to waters within the Great Lakes Basin.	NO	YES	YES	NO

ATTAINS Parameter Name	IDEM Definition	Applicable Uses			
		Full Body Contact	Aquatic Life Use	Public Water Supply	Human Health & Wildlife
HEXACHLOROBENZENE	Concentration of Hexachlorobenzene exceeds Indiana's water quality standards for public water supply in source waters (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	NO	YES	NO
HEXACHLOROBUTADIENE	Concentration of Hexachlorobutadiene exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
HEXACHLOROCYCLO-PENTADIENE	Concentration of Hexachlorocyclopentadiene exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
HEXACHLOROETHANE	Concentration of Hexachloroethane exceeds Indiana's water quality standards for public water supply in source waters (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	NO	YES	NO
ISOPHORONE	Concentration of Isophorone exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
LEAD	Concentration of Dissolved Lead exceeds Indiana's water quality standards for aquatic life use support (327 IAC 2-1-6 or 327 IAC 2-1.5.8) and/or concentration of Total Lead exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	YES	YES	NO
MERCURY IN FISH TISSUE	The trophic level-weighted geometric mean concentration of total and/or methylmercury exceeds the benchmark criterion specified in IDEM's Consolidated Assessment and Listing Methodology (CALM) for fish consumption assessments.	NO	NO	NO	YES

ATTAINS Parameter Name	IDEM Definition	Applicable Uses			
		Full Body Contact	Aquatic Life Use	Public Water Supply	Human Health & Wildlife
MERCURY, DISSOLVED	The concentration of Dissolved Mercury exceeds Indiana's water quality standards for aquatic life use in waters within the Great Lakes Basin (327 IAC 2-1.5-8). Does not apply to waters outside the Great Lakes Basin.	NO	YES	NO	NO
MERCURY, TOTAL	The concentration of Total Mercury exceeds Indiana's water quality standards for aquatic life use in waters outside the Great Lakes Basin (327 IAC 2-1-6) and/or the concentration of Total Mercury exceeds Indiana's water quality standards for public water supply in source waters (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	YES	YES	NO
METHYLENE CHLORIDE	Concentration of Menthylene Chloride (also known as Dichloromethane) exceeds Indiana's water quality standards for public water supply in source waters within the Great Lakes Basin (327 IAC 2-1.5-8).	NO	NO	YES	NO
METHYLMERCURY	Total Methylmercury exceeds Indiana water quality standards for public water supply in source waters within the Great Lakes Basin (327 IAC 2-1.5-8(b))	NO	NO	YES	NO
NICKEL	Concentration of Dissolved Nickel exceeds Indiana's water quality standards for aquatic life use support (327 IAC 2-1-6 or 327 IAC 2-1.5-8) and/or concentration of Total Nickel exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	YES	YES	NO
NITRATE/NITRITE (NITRITE + NITRATE AS N)	Concentration of Nitrogen (Nitrate + Nitrite) exceeds Indiana water quality standards for public water supply (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	NO	YES	NO
NITROBENZENE	Concentration of Nitrobenzene exceeds Indiana's water quality standards for public water supply in source waters outside the Great Laks Basin (327 IAC 2-1-6).	NO	NO	YES	NO

ATTAINS Parameter Name	IDEM Definition	Applicable Uses			
		Full Body Contact	Aquatic Life Use	Public Water Supply	Human Health & Wildlife
NITROGEN, NITRITE	Concentration of Nitrogen (Nitrite) exceeds Indiana water quality standards for public water supply (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	NO	YES	NO
NUTRIENTS	Two or more of the nutrient benchmarks identified in IDEM's consolidated Assessment and Listing Methodlogy (CALM) for aquatic life use are exceeded on the same day.	NO	YES	NO	NO
PARATHION	Concentration of Parathion exceeds Indiana water quality standards for aquatic life use (327 IAC 2-1 or 327 IAC 2-1.5).	NO	YES	NO	NO
PCBS IN FISH TISSUE	Concentration of PCBs in Fish Tissue exceeds the benchmark criterion specified in IDEM's Consolidated Assessment and Listing Methodology (CALM) for fish consumption assessments.	NO	NO	NO	YES
PENTACHLOROBENZENE	Concentration of Pentachlorobenzene exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
PENTACHLOROPHENOL (PCP)	Concentration of Pentachlorophenol (PCP) exceeds Indiana water quality standards for aquatic life use (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	YES	NO	NO
PH	pH value exceeds Indiana water quality standards for aquatic life use (327 IAC 2-1 or 327 IAC 2-1.5).	NO	YES	NO	NO
PHENOL	Concentration of Phenol exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO

ATTAINS Parameter Name	IDEM Definition	Applicable Uses			
		Full Body Contact	Aquatic Life Use	Public Water Supply	Human Health & Wildlife
PHOSPHORUS, TOTAL	Total phosphorus concentration combined with Chlorophyll *a* results exceed the benchmarks for recreational use support (aesthetics) provided in IDEM's Consolidated Assessment and Listing Methodology.	YES	NO	NO	NO
POLYCHLORINATED BIPHENYLS (PCBS)	Concentration of Total Polychlorinated Biphenyls (PCB) (sum of all cogeners) exceed Indiana water quality standards for public water supply in source waters anywhere in the state (327 IAC 2-1-6 or 327 IAC 2-1.5-8) and/or for aquatic life use in waters outside of the Great Lakes Basin (327 IAC 2-1-6).	NO	YES	YES	NO
POLYCYCLIC AROMATIC HYDROCARBONS (PAHS) (AQUATIC ECOSYSTEMS)	Concentration of Polycyclic Aromatic Hydrocarbons (PAHs) exceed Indiana's water quality standards for public water supply in source water outside the Great Lakes Basin (327 IAC 2-1-6); Includes Benzo(a)pyrene.	NO	NO	YES	NO
SELENIUM	Concentration of Dissolved Selenium exceeds Indiana's water quality standards for aquatic life use support for waters within the Great Lakes Basin (327 IAC 2-1.5-8).	NO	YES	NO	NO
SELENIUM, TOTAL	Concentration of Total Selenium exceeds Indiana's water quality standards for aquatic life use and/or public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	YES	YES	NO
SILVER	Concentration of Dissolved Silver exceeds Indiana's water quality standards for aquatic life use support and/or concentration of Total Silver exceeds Indiana water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6); Not applicable to waters within the Great Lakes Basin.	NO	YES	YES	NO

ATTAINS Parameter Name	IDEM Definition	Applicable Uses			
		Full Body Contact	Aquatic Life Use	Public Water Supply	Human Health & Wildlife
SULFATE	Sulfate concentration exceeds Indiana's water quality standards for aquatic life use and/or for public water supply (327 IAC 2-1-6 or 327 IAC 2-1.5.8).	NO	YES	YES	NO
TEMPERATURE	Temperature exceeds Indiana's water quality standards for aquatic life use (327 IAC 2-1-6 or 327 IAC 2-1.5-8) or the Ohio River Valley Sanitation Commission (ORSANCO) Pollution Control Standards (PCS) for aquatic life use in the Ohio River.	NO	YES	NO	NO
TETRACHLOROETHYLENE	Concentration of Tetrachloroethyene exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
THALLIUM	Concentration of Total Thallium exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6(a)).	NO	NO	YES	NO
TOLUENE	Concentration of Toluene exceeds Indiana's water quality standards for public water supply in source waters (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	NO	YES	NO
TOTAL DISSOLVED SOLIDS (TDS)	Concentration of Total Dissolved Solids (TDS) exceeds Indiana's water quality standards for public water supply (327 IAC 2-1-6 or 327 IAC 2-1.5.8).	NO	NO	YES	NO
TOXAPHENE	Concentration of Toxaphene exceeds Indiana water quality standards for public water supply in source waters (327 IAC 2-1-6 or 327 IAC 2-1.5-8) and/or for aquatic life use in waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	YES	YES	NO
TRICHLOROETHYLENE (TCE)	Concentration of Tetrachloroethylene (also known as Trichloroethene or TCE) exceeds Indiana's water quality standards for public water supply in source waters (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	NO	YES	NO

ATTAINS Parameter Name	IDEM Definition	Applicable Uses			
		Full Body Contact	Aquatic Life Use	Public Water Supply	Human Health & Wildlife
VINYL CHLORIDE	Concentration of Vinyl Chloride exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
ZINC, DISSOLVED	Concentration of Dissolved Zinc exceeds Indiana's water quality standards for aquatic life use support (327 IAC 2-1-6 or 327 IAC 2-1.5-8).	NO	YES	NO	NO
1,1,1-TRICHLOROETHANE	Concentration of 1,1,1-Trichloroethane exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
1,1,2,2-TETRACHLOROETHANE	Concentration of 1,1,2,2-Tetrachloroethane exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
1,1,2-TRICHLOROETHANE	Concentration of 1,2-Trichloroethane exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
1,1-DICHLOROETHYLENE	Concentration of 1,1-Dichloroethylene exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
1,2,4,5-TETRACHLOROBENZENE	Concentration of 1,2,4,5-Tetrachlorobenzene exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
1,2-DICHLOROETHANE	Concentration of 1,2-Dichloroethane exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO

ATTAINS Parameter Name	IDEM Definition	Applicable Uses			
		Full Body Contact	Aquatic Life Use	Public Water Supply	Human Health & Wildlife
2,4,5-TRICHLOROPHENOL	Concentration of 2,4,5-Trichlorophenol exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
2,4,6-TRICHLOROPHENOL	Concentration of 2,4,6-Trichlorophenol exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
2,4-DICHLOROPHENOL	Concentration of 2,4-Dichlorophenol exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO
2,4-DIMETHYLPHENOL	Concentration of 2,4-Dimethylphenol exceeds Indiana's water quality standards for public water supply in source waters within the Great Lakes Basin (327 IAC 2-1.5-8).	NO	NO	YES	NO
2,4-DINITROPHENOL	Concentration of 2,4-Dinitrophenol exceeds Indiana's water quality standards for public water supply in source waters within the Great Lakes Basin (327 IAC 2-1.5-8).	NO	NO	YES	NO
2,4-DINITROTOLUENE	Concentration of 2,4-Dinitrotoluene exceeds Indiana's water quality standards for public water supply in source waters outside the Great Lakes Basin (327 IAC 2-1-6).	NO	NO	YES	NO

Table 4: ATTAINS sources that IDEM may use to describe the sources and/or activities suspected of driving water quality impairments. Not all of these sources are currently in use in Indiana's data set. Rather, this list represents the subset of all potential sources available in ATTAINS that Indiana might use.

ATTAINS Source Name	IDEM Definition
AGRICULTURE	
AGRICULTURE	Agriculture can represent a wide array of potential agriculture-related sources. Agriculture is used when either land-use analysis or impairment point to some type of agriculture being the source, but a specific type of agriculture could not be identified.
CROP PRODUCTION WITH SUBSURFACE DRAINAGE	Impacts from pollutants such as nutrients and agrichemicals entering surface waters through agricultural tiles draining cropland.
LIVESTOCK (GRAZING OR FEEDING OPERATIONS)	Insufficient information exists to specifically identify a particular type of animal feeding operation. Includes grazing and unpermitted animal feeding operations. May also include confined feeding operations (CFOs) unless a permitted facility is identified. If suspected source is land application of wastes from a permitted CFO, CONFINED ANIMAL FEEDING OPERATIONS (NPS) applies. In Indiana, CFOs are zero-discharge permits. If suspected source is a runoff or a direct discharge from a permitted feeding operation, CONFINED ANIMAL FEEDING OPERATIONS - CAFOS (POINT SOURCE) applies.
UNRESTRICTED CATTLE ACCESS	Impacts resulting from unrestricted cattle access; includes pathogen-related impairments and impacts to aquatic communities such as destruction of aquatic habitat, streambank instability and erosion.
CONFINED ANIMAL FEEDING OPERATIONS - CAFOS (POINT SOURCE)	Runoff or direct discharge from a permitted feeding operation in violation of the permit.
CONFINED ANIMAL FEEDING OPERATIONS (NPS)	Pollution resulting from inappropriate land application of manure from permitted confined feeding operations.
CONSTRUCTION	
HIGHWAYS, ROADS, BRIDGES, INFRASTRUCTURE (NEW CONSTRUCTION)	New construction involving infrastructure (roads, bridges, pipelines, etc.); does not include construction of residential development or construction of other types of buildings (See SITE CLEARANCE (LAND DEVELOPMENT OR REDEVELOPMENT).
SITE CLEARANCE (LAND DEVELOPMENT OR REDEVELOPMENT)	Impacts from residential and/or industrial construction activities within or outside municipal boundaries; includes new construction or redevelopment in existing urbanized areas; does not include construction of highways, roads, bridges, or other infrastructure (See HIGHWAYS, ROADS, BRIDGES, INFRASTRUCTURE (NEW CONSTRUCTION)).
GROUND WATER LOADINGS	
CONTAMINATED GROUNDWATER	Impacts from contaminants leaching into surface waters from the underlying groundwater.

ATTAINS Source Name	IDEM Definition
HABITAT ALTERATIONS (NOT DIRECTLY RELATED TO HYDROMODIFICATION)	
HABITAT MODIFICATION - OTHER THAN HYDROMODIFICATION	Habitat Modification - other than Hydromodification. Habitat modification has taken place, but a more specific type of habitat modification could not be identified. This code should not be used in combination with LOSS OF RIPARIAN HABITAT, which identitifies more specifically the type of habitat modifications driving impairment.
LOSS OF RIPARIAN HABITAT	Impacts resulting from removal of the riparian habitat including vegetation, snags, undercut banks, etc.); May include legal drain maintenance when such maintenance results in the removal of riparian habitat.
HYDROLOGIC ALTERATION	
CHANNELIZATION	Indicates impacts from modifications to the channel width, depth, or shape, including straightening of the channel; may include legal drain maintenance where maintenance activities alter the stream channel width, depth or shape.
DAM OR IMPOUNDMENT	An existing structure either upstream or downstream of the impairment that creates an impoundment resulting in impacts to dissolved oxygen and/or biological communities. Includes fish community impacts related to structures such as culverts to dams that limit fish passage.
INDUSTRIAL	
INDUSTRIAL POINT SOURCE DISCHARGE	Impacts resulting from end-of-pipe discharges from National Pollutant Discharge Elimination System (NPDES) PDES-permitted industrial facilities; does not apply to thermal impacts from NPDES facilities (See INDUSTRIAL THERMAL DISCHARGES).
INDUSTRIAL THERMAL DISCHARGES	Thermal Impacts resulting from end-of-pipe discharges from NPDES-permitted industrial facilities; does not apply to other types of impacts from industrial NPDES-permitted discharge (See INDUSTRIAL POINT SOURCE DISCHARGE).
LAND APPLICATION/WASTE SITES/TANKS	
DISCHARGES FROM BIOSOLIDS (SLUDGE) STORAGE, APPLICATION OR DISPOSAL	Impacts from inadequate handling or land application of sludge (now biosolids) derived from publicly owned treatment works (POTW) wastewater treatment systems.
SALT STORAGE SITES	Impacts resulting from runoff from stockpiles and/or use of sand/salt mixtures in urban areas used for winter ice removal on roads and bridges.

ATTAINS Source Name	IDEM Definition
LEGACY/HISTORICAL POLLUTANTS	
CERCLA NPL (SUPERFUND) SITES	Pollution related to releases or discharges from waste sites on the federal National Priority List (NPL) developed under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) (commonly known as Superfund).
CONTAMINATED SEDIMENTS	Impacts related to elevated levels of pollutants in sediments.
MUNICIPAL DISCHARGES/SEWAGE	
COMBINED SEWER OVERFLOWS	Impacts from combined sewer overflows (CSOs); applies only to recreational use or aquatic life use impairments downstream of CSOs.
ILLICIT CONNECTIONS/HOOK-UPS TO STORM SEWERS	Illicit connections to storm sewers in urban or semi-urban areas served by sanitary sewers; source generally applied to impairments in urban areas; does not include straightpipes or tie-ins to agricultural drainage tiles (See SEWAGE DISCHARGES IN UNSEWERED AREAS).
MUNICIPAL POINT SOURCE DISCHARGES	Impacts resulting from end-of-pipe discharges from publicly owned treatment works (POTWs).
MUNICIPAL POINT SOURCE IMPACTS FROM INADEQUATE INDUSTRIAL/COMMERCIAL PRETREATMENT	Impacts resulting from inadequate pretreatment of industrial/commercial wastes before they are introduced into sanitary sewer systems connected to POTWs. Impacts can include wastewater treatment plant upsets, line blockages and other symptoms associated with sanitary sewer overflows (SSOs).
PACKAGE PLANT OR OTHER PERMITTED SMALL FLOWS DISCHARGES	Impacts from NPDES-permitted semi-public facilities including treatment systems for small communities or rural schools that often operate only intermittently.
SANITARY SEWER OVERFLOWS (COLLECTION SYSTEM FAILURES)	Impacts resulting from a pump station or lift station overflow or a sewer line break.
SEPTAGE DISPOSAL	Pollution from spills or other inappropriate handling of septage hauled from domestic or other onsite treatment systems.
SEWAGE DISCHARGES IN UNSEWERED AREAS	Impacts from failing septic systems, straightpipes and domestic waste water system tie-ins to agricultural tiles.
NATURAL/WILDLIFE	
DROUGHT-RELATED IMPACTS	Drought episodes, which in some cases can last several years, can deplete water supplies and accentuate pollution problems affecting human and ecological health.

ATTAINS Source Name	IDEM Definition
NATURAL SOURCES	Natural Sources can represent one or a combination of factors that are natural occurring, and no other potential sources can be identified; applies to impairments suspected to be driven entirely by factors natural occurring; does not apply in combination with other source codes.
OTHER	
SOURCES OUTSIDE STATE JURISDICTION OR BORDERS	Sources Outside State Jurisdiction or Borders. The source of the impairment is beyond the borders of the State. Therefore, the state has no jurisdiction over the management of that source.
UPSTREAM SOURCE	Applies to impairments where the source is attributable in part or whole to sources upstream of the boundaries of the assessment unit.
RECREATION AND TOURISM (NON-BOATING)	
GOLF COURSES	Pollution effects (usually nutrient -related) from operation of golf course facilities.
RESOURCE EXTRACTION	
COAL MINING DISCHARGES (PERMITTED)	Impacts from coal mining activities subject to NPDES industrial permitting (usually general permits); applies only to active mining operations in new or previously mined areas, not from inactive and/or abandoned mines.
IMPACTS FROM ABANDONED MINE LANDS (INACTIVE)	Legacy impacts from inadequately reclaimed surface or underground mines (including strip mines); may be applied to historic coal or other mineral mining operations resulting in releases of cyanide, heavy metals, and acid generated from mine waste (also known as acid mine drainage).
SILVICULTURE (FORESTRY)	
SILVICULTURE ACTIVITIES	Pollution from aspects of forest harvesting including both registered and non-registered operations.
SPILLS/DUMPING	
ILLEGAL DUMPS OR OTHER INAPPROPRIATE WASTE DISPOSAL	Impacts from illegal dumping and other inappropriate disposal of solid wastes or other wastes that may contain conventional or hazardous pollutants that can degrade aquatic habitats or otherwise impair aesthetic amenities.
UNKNOWN	
SOURCE UNKNOWN	Applied when insufficient data exists at the time of assessment to identify a source; associated primarily with fish tissue impairments, biological community impairments, and chemistry impairments not typically associated with non-point sources.
UNSPECIFIED NONPOINT SOURCE	
NON-POINT SOURCE	Source is unknown, but there are no permitted point sources upstream.

ATTAINS Source Name	IDEM Definition
URBAN-RELATED RUNOFF/STORMWATER	
UNSPECIFIED URBAN STORMWATER	Generalized Impacts from stormwater in urban areas. IDEM applies this code only to aquatic life use impairments. Recreational use impairments driven by stormwater in urban areas with no CSOs upstream are keyed to URBAN-RELATED RUNOFF/STORMWATER. Recreational use impairments in which CSOs are located upstream are keyed to COMBINED SEWER OVERFLOWS.
WASTES FROM PETS	Pathogen-related pollution impacts from pet wastes in urbanized areas where contaminants can enter storm sewers or otherwise introduce pollutants into receiving waters.
WET WEATHER DISCHARGES (NON-POINT SOURCE)	Applied only to recreational use impairments in urban areas during or after wet weather events where a specific point source could not be identified. Does not apply to recreational use impairments downstream of CSOs (See COMBINED SEWER OVERFLOWS) or aquatic life use impairments (see UNSPECIFIED URBAN STORMWATER).
YARD MAINTENANCE	Pollution from lawns, gardens, and other plantings on private residences or other areas around dwellings and buildings with areas in horticultural plantings.

Table 5: ATTAINS method codes that IDEM may use to describe the nature of the data used in assessments.

ATTAINS Method Code	ATTAINS Method Name	IDEM Definition
150	Monitoring data more than 5 years old	Applies to fish tissue assessments, which are based on data spanning an index period of 12 years.
210	Fixed station physical/chemical monitoring (conventional pollutants only)	Used for aquatic life use assessments based on physical/chemistry data that ***does not*** include results for toxicants (e.g. dissolved metals, free cyanide, and ammonia) collected by IDEM at its fixed station monitoring sites. If the data set does include toxicants, Code 230 applies.
220	Non-fixed station physical/chemical monitoring (conventional pollutant only)	Used for aquatic life use assessments based on physical/chemistry data that ***does not*** include results for toxicants (e.g. dissolved metals, free cyanide, ammonia) collected by IDEM at its probabilistic or targeted monitoring sites. If the data set does include toxicants, Code 240 applies.
230	Fixed station physical/chemical (conventional plus toxic pollutants)	Used for aquatic life use assessments based on physical/chemistry data that includes results for toxicants (e.g. dissolved metals, free cyanide, and ammonia) collected by IDEM at its fixed station sites. If the data set does not include toxicants, Code 210 applies.
240	Non-fixed station physical/chemical (conventional + toxicants)	Used for aquatic life use assessments based on physical/chemistry data that includes results for toxicants (e.g. dissolved metals, free cyanide, ammonia) collected by IDEM at its probabilistic or targeted monitoring sites. If the data set does not include toxicants, Code 220 applies.

ATTAINS Method Code	ATTAINS Method Name	IDEM Definition
260	Fish tissue analysis	Used for fish consumption assessments based on fish tissue data collected by IDEM.
270	PWS chemical monitoring (ambient water)	Used for assessments of public water supply (PWS) based on chemistry results from ambient water sample(s) collected at a facility's intake and/or from the raw water tap within the facility. Code applies to such data collected by IDEM and/or data provided to IDEM by the facility and quality assured by IDEM through its External Data Framework (EDF).
320	Benthic macroinvertebrate surveys	Used for aquatic life use assessments based on the results of benthic macroinvertebrate community surveys conducted by IDEM with or without corresponding fish community and/or primary producer survey results.
330	Fish surveys	Used for aquatic life use assessments based on the results of fish community surveys conducted by IDEM with or without corresponding macroinvertebrate community and/or primary producer survey results.
340	Primary producer surveys (phytoplankton/periphyton/macro phyton)	Used for aquatic life use assessments based on the results of primary producer surveys conducted by IDEM with or without corresponding fish and/or macroinvertebrate community survey results.
360	HABITAT ASSESSMENT	Used for aquatic life use assessments in which habitat surveys were used to augment assessments. All biological monitoring conducted by IDEM includes habitat assessments. However, assessments are never based solely on habitat results.
420	Water column surveys (e.g. fecal coliform)	Used for assessments of recreational use (human health) based on E. coli data collected by IDEM at its probabilistic or targeted monitoring sites. For assessments based on secondary data submitted through the External Data Framework (EDF), use code 830 if those data were provided by volunteers and code 860 if provided by an external agency/organization (e.g. a municipality).
450	PWS pathogen monitoring (finished water)	Used for assessment of public water supply (PWS) based on the results of a facility's Level 1 and/or Level 2 assessments performed in accordance with the Revised Total Coliform Rule (RTCR), which are triggered based on results from finished water samples.
850	(Ambt.) Discharger self-monitoring data	Used for assessments based on ambient monitoring data provided by permittees and quality-assured through IDEM's External Data Framework (EDF).
860	Other Agencies/Organizations provided monitoring data	Used for all Ohio River mainstem assessments based on data and information collected by ORSANCO but not submitted through the External Data Framework (EDF). Assessments made with ORSANCO data are conducted in collaboration with Compact member states.

ATTAINS Method Code	ATTAINS Method Name	IDEM Definition
861	Secondary Data - Physical/Chemical	Used for lake and/or stream assessments based on physical/chemical monitoring data provided by individuals/organizations and quality assured through IDEM's External Data Framework (EDF). Includes data provided by Clean Lakes Program and/or Hoosier Riverwatch Program volunteers. For Ohio River assessments based on data and information collected by ORSANCO but not submitted through the EDF, Code 860 applies.
862	Secondary Data - Benthic Macroinvertebrate Community	Used for stream assessments based on benthic macroinvertebrate community data provided by individuals/organizations and quality assured through IDEM's External Data Framework (EDF). Includes data provided by Hoosier Riverwatch Program volunteers.
863	Secondary Data - Fish Community	Used for stream assessments based on fish community data provided by individuals/organizations and quality assured through IDEM's External Data Framework (EDF).
864	Secondary Data - Phytoplankton	Used for lake and/or stream assessments based on phytoplankton community data provided by individuals/organizations and quality assured through IDEM's External Data Framework (EDF). Includes data provided by Clean Lakes Program.
865	Secondary Data - Fish Tissue	Used for lake and/or stream assessments based on fish tissue data provided by individuals/organizations and quality assured through IDEM's External Data Framework (EDF). Includes data provided by Clean Lakes Program. For Ohio River assessments based on fish tissue data collected by ORSANCO but not submitted through the EDF, Code 860 applies.
866	Secondary Data - Habitat	Used for stream assessments augmented with habitat data provided by individuals/organizations and quality assured through IDEM's External Data Framework (EDF). Includes data provided by the Hoosier Riverwatch program.
910	Physical/Chemical ALUS (Discrepancy among different data types)	Used for aquatic life use assessments in which the physical/chemical data indicates impairment ***and*** biological data for one/more assemblages indicates full support.
915	Biological Community ALUS (Discrepancy among different assemblages)	Used for aquatic life use assessments in which the biological data for one assemblages indicates impairment and results for another indicate full support.
920	Biological ALUS (Discrepancy among different data types)	Used for aquatic life use assessments in which the biological data for one/more assemblages indicates impairment ***and*** chemistry data indicates full support.
925	Habitat ALUS (Discrepancy among different data types)	Used for aquatic life use assessments in which the biological data for one/more assemblages indicates impairment ***and*** their corresponding Qualitative Habitat Evaluation Index (QHEI) scores are greater than or equal to 51 indicating good habitat conditions.

Table 6: User-defined fields ATTAINS.

Flag	Description
Partial	A relict impairment transferred from the ADBv1; Flag will be eliminated when questionable assessment is resolved through database QAQC.
Not Attainable	Applies to aquatic life use assessments on limited use waters.
IIFA – PCB	Used to indicate where data are available but insufficient for assessment; Applied only to fish tissue data.
IIFA – Hg	Used to indicate where data are available but insufficient for assessment; Applied only to fish tissue data.
Aesthetics	Used to distinguish recreational use for aesthetics (chlorophyll a, phosphorus, etc.) versus recreational use for human health (*E. coli*).
QAQC-RI	Need to map verify that this reach exists. May have been reindexed and not properly retired.
QAQC	QAQC needed for one/more assessments related to this AUID

Table 7: Common abbreviations used in comment fields in ATTAINS.

Abbreviation	Definition	Abbreviation	Definition
ALUS	Aquatic life use	IBI	Fish community index of biotic integrity
BMP	Best management practice	CAFO	Confined animal feeding operation
BPJ	Best professional judgment	WTP or WWTP	Wastewater treatment plant
DS	Downstream	BM	Benchmarks
DW	Drinking water	HD	Hester-Dendy sampling method (macroinvertebrates)
FCA	Fish consumption advisory	RSD	Regional sewer district
FISH	Fish consumption	mHAB	Multihabitat sampling method (macroinvertebrates)
FS	Fully supporting	QHEI	Qualitative habitat evaluation index
FWS or USFWS	U.S. Fish and Wildlife Service	CSO	Combined sewer overflow
GM	Geometric mean	SSO	Sanitary sewer overflow
HW	Headwater	TP	Total phosphorus
MS	Mainstem	HG	Mercury
NA	Not assessed or Not applicable	NH3	Ammonia
NPS	Nonpoint source	POTW	Publicly owned treatment works
NS	Not supporting (impaired)	DO	Dissolved oxygen
PWS	Public water supply	KICK	Kick sampling method (macroinvertebrates)
RECR	Recreational use	mIBI	Macroinvertebrate community index of biotic integrity
US	Upstream	PCB	Polychlorinated biphenyls
USGS	U.S. Geological Survey	CFO	Confined feeding operation
WS	Watershed	N or N+N	Nitrogen or Nitrogen as N+N

APPENDIX D:

STATUS OF CATEGORY 4 WATERS

STATUS OF CATEGORY 4 WATERS AS OF INDIANA'S 2020 INTEGRATED REPORT SUBMITTAL

In accordance with U.S. EPA guidance (U.S. EPA 2001, 2005, 2006, 2009, 2011, 2013, 2015, and 2017), Indiana's Category 4 waters are identified in Indiana's Consolidated List, which is included in Indiana's 2020 Integrated Monitoring and Assessment Report, Appendix L. Category 4 consists of impairments for which a Total Maximum Daily Load (TMDL) is not required. The subcategories of Indiana's Category 4 list are described below:

- Category 4A consists of impairments for which a TMDL has been approved by U.S. EPA and is expected to result in attainment of all applicable water quality standards (WQS).
- Category 4B consists of impairments for which other pollution control requirements are expected to result in the attainment of the WQS in a reasonable period of time.
- Category 4C consists of impairments that are not caused by a pollutant and as such, do not require a TMDL.

Categories 4 and 5 of IDEM's Consolidated List together provide the most comprehensive assessment of impairment of Indiana waters to date. With each 303(d) listing cycle, U.S. EPA requests an update on the status of Indiana's Category 4 waters to facilitate tracking of all known impairments. These impairments and their current status are discussed in the following sections.

CATEGORY 4A IMPAIRMENTS

Category 4A consists of impairments for which a TMDL has been approved by U.S. EPA and is expected to result in attainment of all applicable WQS. IDEM's progress in TMDL development since the 2018 cycle is discussed in the Notice of Comment Period for the draft 2020 303(d) list and in this appendix of the 2020 Integrated Report. This appendix provides a comprehensive update on all TMDLs approved to date and the impairments they cover. With the submittal of its 2020 Integrated Report, IDEM has developed a total of two thousand nine hundred ninety four (2,994) TMDLs, which have been approved by U.S. EPA.

The impairments addressed by these TMDLs can be found in the listing tables provided in Appendix L. Table 1 provides a list of all TMDLs approved to date and a key for their corresponding impairments in Appendix L. which also identifies any changes made as a result of reindexing to the assessment units previously listed in Category 4A. This information appears in the columns with updated assessment unit IDs (AUIDs) and names where applicable.

Table 1: TMDLs approved as of IDEM's submittal of its 2020 Integrated Report.

46	2016	7/14/2014	*Escherichia coli (E. coli)* Total Maximum Daily Load Report for the Lower Big Blue River Watershed
47	2016	9/26/2014	Total Maximum Daily Load Report for the Deep River-Portage Burns Watershed
48	2016	9/30/2015	Total Maximum Daily Load for the Southern Whitewater River Watershed
49	2018	2/24/2017	Total Maximum Daily Load Report for the Upper Mississinewa River Watershed

TMDL Key	IR Cycle	Approval Date	TMDL Document Title
50	2018	9/15/2017	Total Maximum Daily Load Report for the South Fork Blue River Watershed
51	2018	10/26/2017	St. Joseph River Watershed Indiana TMDLs
52	2020	9/10/2018	Total Maximum Daily Load Report for the Lower Salt Creek Watershed
53	2020	12/19/2019	Total Maximum Daily Load Report for the Lower East Fork White River Watershed

CATEGORY 4B IMPAIRMENTS

Category 4B consists of impairments for which other pollution control requirements are expected to result in the attainment of the WQS in a reasonable period of time. As of 2020, IDEM's Category 4B list contains a total of eighteen (18) impairments. IDEM did not add any impairments to Category 4B for the 2020 cycle. However, there were some revision made to the AUIDs assessed as impaired to correctly reflect IDEM's finalized Reach Index.

IDEM originally placed the impairments identified in Table 2 in Category 4B in 2002 based on evidence that the electric generating facilities discharging to these waters were responsible for the thermal impairments identified. The facilities in question have NPDES permits for with thermal discharge limits based on site-specific standards and have contested this decision based on annual reports they had submitted indicating no detrimental effects from their discharges. As a result of this apparently contradictory information, IDEM determined that that additional study was needed to determine whether the monitoring and reporting requirements under section 316(a) were sufficient to ensure a well balanced aquatic community of waters outside the mixing zone.

Through an Interagency Agreement with IDEM, the U.S. Fish and Wildlife Service developed a report entitled, "Evaluation and Assessment of Fish Assemblages Near Electric Generating Facilities: with Emphasis on Review of Discharge Submitted Data, Development of the Standard Operation Procedures, and Traveling Zone Assessment." The objectives of this study were:

- To evaluate the information submitted by the thermal discharge permittees for compliance with 316(a) requirements;
- To develop standard methods that would provide industrial contractors specific protocols for use in meeting permit monitoring requirements for their heated effluents;
- To conduct traveling zone studies of discharge relationships from selected thermal generating facilities, including specifically two of the three facilities to which the above impairments were attributed.

IDEM reviewed the results of this study and determined that additional monitoring and reporting requirements were necessary under Section 316(a) of the Clean Water Act (CWA) and Indiana Administrative Code 327 IAC 5-7 to ensure a well balanced aquatic community of waters outside the mixing zone. In 2006 and 2007, IDEM renewed permits for most electric generating facilities, which included additional conditions that require the permittees to submit a new 316(a) demonstration/variance request with the renewal application for their next NPDES permit cycle. In order to be granted a 316(a)

variance, these facilities must include a site-specific biological study plan in their request that demonstrates that the variance will not result in biological impairment outside the mixing zone.

IDEM recently developed a guidance for permittees requesting a 316(a) thermal limits variance in their NPDES permit: "*Guidance for Conducting a Demonstration as a Requirement of a 316(a) Alternative Thermal Effluent Limitation Request".* This document contains the guidance necessary for completing an application for alternative thermal effluent limitations, a Type I, II, or III Demonstration, and sampling and monitoring consistent with associated standard operating procedures. A demonstration for alternative thermal effluent limitations, in accordance with section 316(a) of the CWA and 327 IAC 5-7, should provide IDEM with adequate information to establish alternative thermal effluent limitations that will ensure the protection and propagation of a Balanced, Indigenous Community (BIC) in and on the waters into which a thermal discharge is made. IDEM's guidance document is currently under internal (IDEM/U.S. EPA) review. In the meantime until IDEM begins full implementation of its approach to issuing 316(a) thermal variances, when NPDES permits with existing 316(a) thermal variances come up for renewal, IDEM is adding year round alternative thermal limits (if they do not already exist) to the permit until a complete revised 316(a) application can be submitted and evaluated.

With regard specifically to Turtle Creek Reservoir, IDEM did not renew the 316(a) thermal variance the Hoosier Energy – Merom Generating Station NPDES Permit at the time the permit was up for renewal (December 22, 2010). The facility was instead given a three-year schedule of compliance to meet the thermal water quality standards found in rule but were unsuccessful. The facility entered into an Agreed Order that was adopted on December 30, 2013. The Agreed Order requires the facility to submit a 316(a) study plan for review and comment in the spring of 2014. On January 21, 2020, Hoosier Energy announced its intention to close the plant in 2023 as part of its new 20-year resource plan. IDEM anticipates that this closure will result in significant improvement in thermal conditions in the reservoir.

Table 2: Category 4B impairments attributed to electrical generating facility discharges.

Table 3 identifies Category 4B impairments attributed to other sources. These waters were placed on in Category 4B in 2004. The identified impairments were attributed to the Picnic Wood Wastewater Treatment Plant, owned by LMH Utilities Corporation and are presently being addressed through IDEM's NPDES program. LMH Utilities Corporation completed upgrades to its facility in late 2007. The plant continues to have sporadic compliance issues including effluent violations for ammonia in 2015 and a sanitary sewer overflow at the main lift station in 2018 as well as ongoing operational issues. These impairments will remain in Category 4B through the 2020 303(d) listing cycle to allow time for IDEM to conduct the follow-up monitoring necessary to determine if the current biological condition of these waters.

CATEGORY 4C IMPAIRMENTS

To date, Category 4C consists of seventeen (17) impairments that are not caused by a pollutant and as such, do not require a TMDL. These are impairments resulting from stressors for which a load cannot be calculated. Category 4C impairments and their sources are shown in Table 4. Although a TMDL is not required for these impairments, IDEM may conduct additional monitoring on these waters through its rotating basin monitoring schedule. IDEM did not add any impairments to Category 4C for the 2020 cycle. However, there were a number of impairments removed from this list based on IDEM's review of the segmentation of the reaches originally approved for Category 4C. These changes were made to 4 correctly reflects IDEM finalized Reach Index and can be found in the Category 4 change file in Appendix L.

APPENDIX E:
IDEM'S PRIORITY RANKING AND 2020-2022 SCHEDULE FOR TOTAL MAXIMUM DAILY LOAD DEVELOPMENT

Table 1 provides a list of total maximum daily load (TMDL) reports planned for 2020-2022 as of April 1, 2020. Table 2 provides the list of known impairments that these TMDLs may address. This list is not comprehensive as additional impairments are commonly identified as a result of the additional sampling and reassessment that occurs as part of the TMDL development process. This list reflects IDEM's TMDL Priority Framework, which appears at the end of this Appendix.

Table 1: TMDLs planned for 2020-2022 as of April 1, 2020.

IDEM TMDL Key	TMDL
54	Total Maximum Daily Load Report for the Maria Creek Watershed
55	Total Maximum Daily Load Report for the Laughery Creek Watershed

*These numbers correspond to the TMDL Key in Appendix D of the Integrated Report, which identifies all 55 TMDL reports approved to date.

Table 2: Impairments to be included in TMDLs developed for 2020-2022.

Indiana's 303(d) TMDL Program Priority Framework:

A Process for Implementing the National CWA 303(d) Long-Term Vision in Indiana

Watershed Planning and Restoration Section

Watershed Assessment and Planning Branch

Office of Water Quality

Indiana Department of Environmental Management

July 8, 2015

Background

The U.S. Environmental Protection Agency (U.S. EPA) has worked with State program managers to develop a new long-term Vision and Goals for the Clean Water Act (CWA) Section 303(d) Program. In Section 303(d) of the CWA, States are required to develop a list of impaired waters that do not meet State water quality standards, and establish priority rankings for waters on the list to develop Total Maximum Daily Loads (TMDLs). The purpose of this revision to the existing CWA Section 303(d) program is to assist with focusing State efforts to advance the effectiveness of the program in the future. Currently there are six tenants that form the groundwork of the new national long-term vision ("the Vision"):

Prioritization – For the 2016 integrated reporting cycle and beyond, States review, systematically prioritize, and report priority watersheds or waters for restoration and protection in their biennial integrated reports to facilitate State strategic planning for achieving water quality goals

Assessment – By 2020, States identify the extent of healthy and CWA Section 303(d) impaired waters in each State's priority watersheds or waters through site-specific assessments

Protection – For the 2016 reporting cycle and beyond, in addition to the traditional TMDL development priorities and schedules for waters in need of restoration, States identify protection planning priorities and approaches along with schedules to help prevent impairments in healthy waters, in a manner consistent with each State's systematic prioritization

Alternatives – By 2018, States use alternative approaches, in addition to TMDLs, that incorporate adaptive management and are tailored to specific circumstances where such approaches are better suited to implement priority watershed or water actions that achieve the water quality goals of each state, including identifying and reducing nonpoint sources of pollution

Engagement – By 2014, EPA and the States actively engage the public and other stakeholders to improve and protect water quality, as demonstrated by documented, inclusive, transparent, and consistent communication; requesting and sharing feedback on proposed approaches; and enhanced understanding of program objectives

Integration – By 2016, EPA and the States identify and coordinate implementation of key point source and nonpoint source control actions that foster effective integration across CWA programs, other statutory programs (e.g., CERCLA, RCRA, SDWA, CAA), and the water quality efforts of other Federal departments and agencies (e.g., Agriculture, Interior, Commerce) to achieve the water quality goals of each state (U.S. EPA 2013).

Indiana's Current Approach

The Clean Water Act (CWA) Section 303(d) Program in Indiana is administered by the Indiana Department of Environmental Management's (IDEM) Watershed Assessment and Planning Branch (WAPB), which also conducts surface water quality monitoring according to *the Indiana Surface Water Quality Strategy, 2011-2019.* While the WAPB uses data from several of its monitoring programs to determine water quality status, it primarily relies on a stratified, random sampling design to meet the CWA 305(b) requirement to "assess all waters." This approach is employed in a rotating basin cycle of nine years and will result in a comprehensive and updated data set for the entire state by 2019. Water quality data collected are assessed using applicable water quality criteria in the State's water quality standards and waterbodies are placed into one or more categories of the state's Consolidated List, available biennially in Indiana's Integrated Report.

While only a portion of the 63,600 miles of streams and rivers in Indiana have been monitored to date (leaving approximately 40,000 miles unassessed due to lack of data), approximately 20,000 miles of streams are listed as impaired under Category 5. Since the inception of the TMDL program in Indiana, 46 TMDL documents have been developed resulting in 1,225 individual TMDLs moving waterbodies from the 303(d) List of Impaired Waters Category 5 into Category 4a. Prior to the commencement of the Vision, IDEM's WAPB worked with U.S. EPA Region 5 every 303(d) listing cycle to determine the number of TMDLs to be developed. With the development of a national focus on showing results of water quality improvement, including the advent of several U.S. EPA focused success measures, Indiana has been moving toward a more holistic approach of TMDL development. In 2005, the TMDL and Nonpoint Source Program (NPS) were combined into the same section to realize efficiencies and better integrate the work of the two programs with the intended outcome that better outreach to watershed organizations would lead to implementation of the Reasonable Assurance section of the TMDL. In 2010, the TMDL and NPS program areas were part of an agency reorganization that resulted in a move to the Assessments Branch, which conducts surface water monitoring. This move allowed the integration of TMDL staff with other monitoring staff, yielding multiple benefits, including a more rigorous sampling design.

In 2012, it was determined that IDEM's involvement in monitoring for watershed management planning would coincide with monitoring done in preparation for a TMDL in the same watershed. The first TMDL project in which this occurred was the Deep River TMDL project, which was monitored in 2013. The TMDL report was approved by U.S. EPA in 2014 and the watershed group is currently incorporating information from the TMDL into a watershed management plan. This TMDL development and implementation strategy has been replicated in four additional watersheds to date, with plans to begin monitoring in yet another watershed in 2015. Key to the success of these projects is the availability of a watershed group in the TMDL watershed – without local support, implementation of the nonpoint source sections of the TMDL is likely to be compromised.

Moving forward with the Vision

At the June 2014 Watershed Planning and Restoration Section staff meeting, a program priority team committee was formed to begin work on Indiana's strategy to implement the national Vision for TMDL programs. The core members of the team were the NPS and TMDL program manager, the TMDL program team leader, the NPS senior watershed planner, and two watershed specialists and Section 319 grant project managers. Ad hoc members were involved as needed, including upper management, other program areas, and watershed monitoring staff. The team members began meeting regularly starting in August 2014, working toward the development of the new Indiana 303(d) TMDL Vision.

Indiana's TMDL Program Prioritization

Priority Watershed Selection Criteria

The focus of this process document is defining the method used to prioritize which waters will be the focus of TMDL planning and watershed restoration. The process for determining the TMDL priority watersheds will meet the following criteria (Figure 1). The first four criteria are required elements, while the remaining criteria are additional considerations when choosing between watersheds identified by working through the first four.

(1) First, the prioritization will begin by identifying those watersheds with impairments based upon Indiana's water quality standards and 303(d) list, since the CWA mandates that TMDLs be developed for impaired waterways. As the monitoring and assessment process continues to discover new impairments, the priority list will be updated from the most recent 303(d) List of Impaired Waters

(2) The second criterion ranks watersheds based on their current ability to meet Indiana's aquatic life designated use. Waters that have been designated with an impaired biotic community, but show a reasonable expectation for ecological recovery by means of a "good" habitat score (QHEI) and likely due to nutrient and/or sediment will be prioritized first for TMDL development. Indiana has a highly modified hydrologic landscape, and where current law and codes prohibit physical stream restoration, NPS improvements will most reasonably show biological community response where adequate habitat already exists. Within these watersheds identified for impaired aquatic life use, IDEM will also prioritize impairments of the recreational use due to exceedances of the *E. coli* criteria.

(3) The third criterion will identify those watersheds where neither an existing TMDL, nor a watershed planning effort has been completed. This criterion minimizes duplication of efforts where work is already progressing to improve water quality.

(4) The fourth criterion to be considered for TMDL development is the reasonable expectation that an entity to drive implementation exists in the watershed. Part of the TMDL process requires the State to provide "reasonable assurance" that the load reduction recommendations will be implemented. The presence of a dedicated entity (e.g. watershed group) motivated to implement a TMDL will reinforce the reasonable assurance of NPS reductions.

Additional Criteria Considered:

- Identify those surface waters that provide a source of water for public drinking water use. Citizens rely on adequate clean water for drinking, commercial and industrial uses for everyday life.

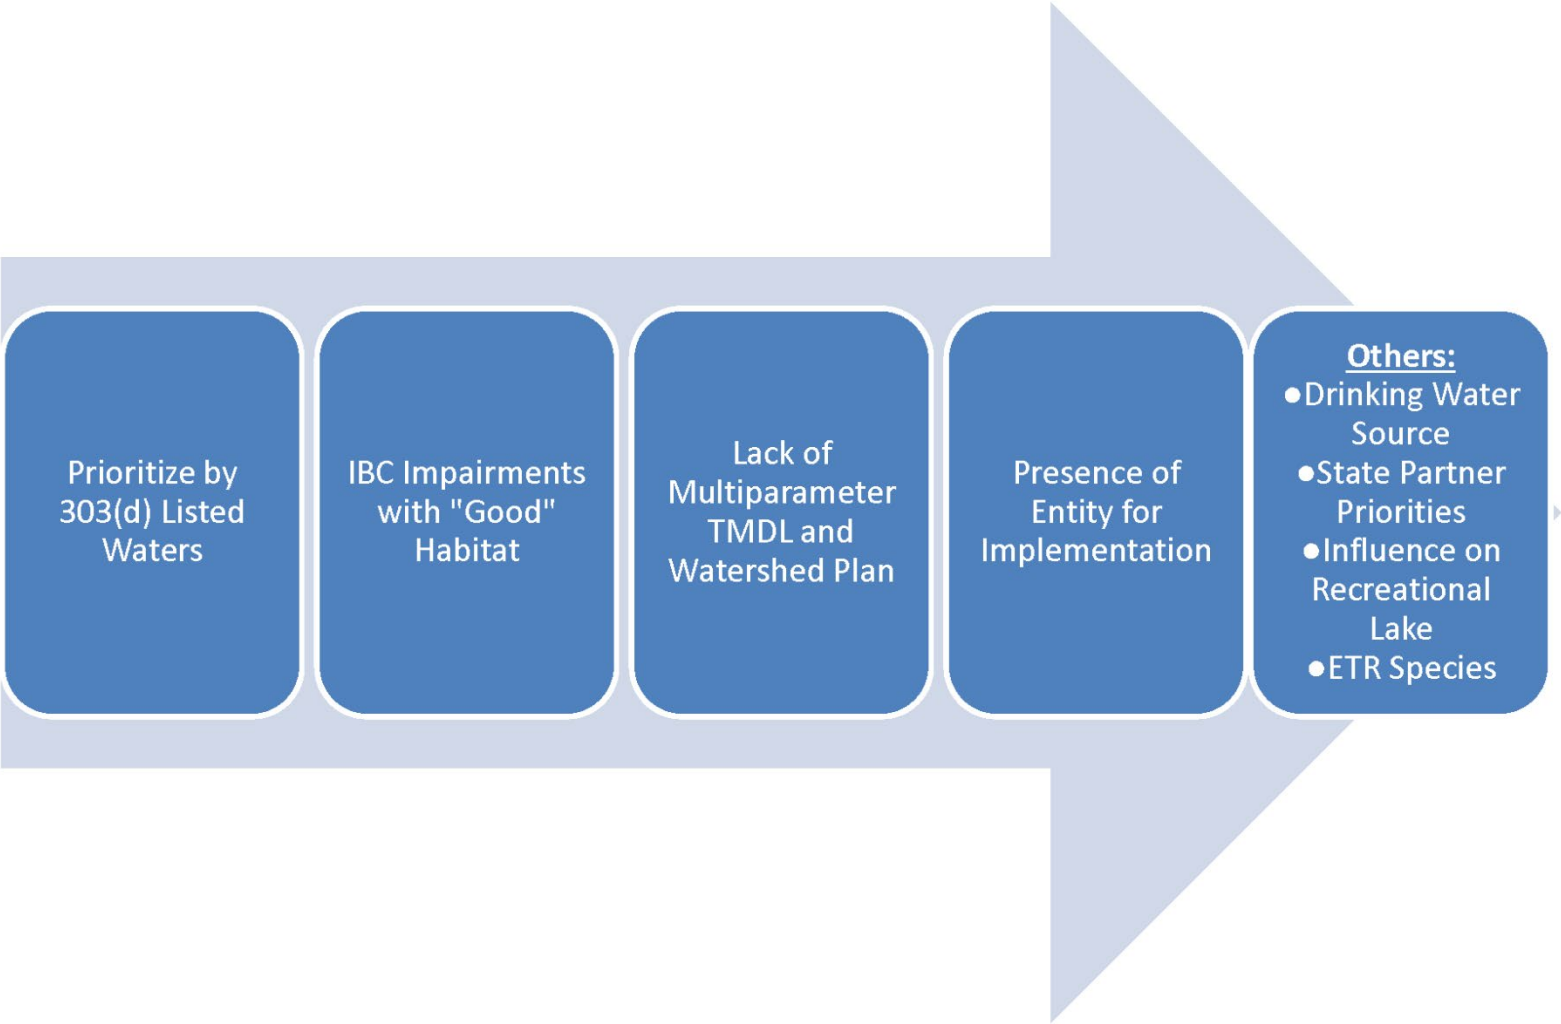
- Identify waters that are upstream of public-access lakes used for recreation. Nutrient-induced harmful algal blooms have been on the rise recently in Indiana lakes and reservoirs, threatening the use of these waterbodies for primary contact recreation.

- Identify waters that are home to endangered, threatened or rare species. Water quality pollution and loss of habitat have reduced the number of some species to critical numbers; restoration and protection of the remaining populations should be a priority.

- TMDL development based on priorities specific to the State of Indiana. This step is based on conversations about overlapping priorities with internal and external agency partners such as the Indiana Conservation Partnership (ICP)[1], as well as consideration of time sensitive or current relevant high profile issues (e.g. Western Lake Erie Basin eutrophication).

[1] The ICP is comprised of eight Indiana agencies and organizations who share a common goal of promoting conservation. Members include the Indiana Association of Soil and Water Conservation Districts, Indiana Department of Environmental Management, Indiana Department of Natural Resources, Indiana State Department of Agriculture, Purdue Cooperative Extension Service, Indiana State Soil Conservation Board, USDA Farm Service Agency and the USDA Natural Resources Conservation Service.

Figure 1 Priority watershed selection process



Priority List 2015-2022

The key to IDEM's current TMDL implementation strategy is the availability of a local stakeholder group ready, willing, and able to implement the TMDL. Due to the nature and dynamics of such groups, the availability of a cohesive group of stakeholders to lead a watershed planning and/or implementation effort subsequent to development of a TMDL is often unknown on a long-term basis. Therefore, though IDEM's process for choosing TMDL watersheds remains consistent, its list of priority watersheds is in a necessary state of flux. IDEM also finds itself with resource constraints that limit its TMDL development commitment to providing TMDLs for one 10-digit watershed per fiscal year. These TMDLs will be restricted to streams and rivers with *E.coli* impairment, and impaired biotic communities caused by one or more of the following conditions:

- Dissolved oxygen
- Algae
- Total Suspended Solids
- Phosphorus

IDEM has agreed with U.S. EPA to develop three TMDLs that are already in progress using the prior selection methods, and one TMDL using the new Vision prioritization method, each focused on 10-digit watershed scales. These four TMDLs are high priority for completion in the short term, as watershed groups are poised to develop plans and drive implementation in the area. These four TMDLs and their completion years are as follows:

- Southern Whitewater River (2015)
- Mississinewa River (2016)
- South Fork Blue River (2016)
- Salt Creek (2017)

The 10-digit watersheds listed in Appendix A may meet IDEM's criteria for TMDL development over the next six years. Each watershed has been selected using the four priority watershed selection criteria (p.3-4). They have been further prioritized for potential short-term and long-term selection using the additional watershed selection criteria (p.4), categorizing them as either high (green), medium (coral), or low (blue). Beginning in 2016, IDEM will select one 10-digit watershed per year for TMDL development and implementation after 2017, as agreed upon with U.S. EPA.

TMDL Alternatives and Protection Strategies

IDEM does not expect to explicitly prioritize TMDL alternatives or protection strategies at this time, but will explore the use of TMDL alternatives and protection strategies as the situation arises, and work with USEPA to collaborate on mutually acceptable plans.

APPENDIX F:

IDEM'S 305(B)/303(D) MONITORING, ASSESSMENT, REPORTING AND LISTING SCHEDULE

Sequence in IDEM's Rotating Basin Monitoring Strategy[a]	Basin(s)	Basin Monitored	Results for the Basin Assessed	Draft 303(d) List Revised Based on Assessment Results and Published for Public Comment Period[b]	Assessment Results Published in Indiana's Integrated Report	Draft 303(d) List Submitted to U.S. EPA for Approval
1	White River, West Fork Basin	2011	2013	2013	2014	2014
2	Patoka River Basin	2012	2014	2015	2016	2016
3	White River, East Fork Basin	2013	2014	2015	2016	2016
4	Great Miami River Basin	2014	2015	2015	2016	2016
5	Upper Wabash River Basin	2015	2016	2017	2018	2018
6	Lower Wabash River Basin	2016	2017	2017	2018	2018
7	Upper Illinois River Basin	2017	2018	2019	2020	2020
8	Great Lakes Basin	2018	2019	2019	2020	2020
9	Ohio River Tributaries	2019	2020	2021	2022	2022
1	White River, West Fork Basin	2020	2021	2021	2022	2022
2	Patoka River Basin	2021	2022	2023	2024	2024
3	White River, East Fork Basin	2022	2023	2023	2024	2024
4	Great Miami River Basin	2023	2024	2025	2026	2026
5	Upper Wabash River Basin	2024	2025	2025	2026	2026
6	Lower Wabash River Basin	2025	2026	2027	2028	2028
7	Upper Illinois River Basin	2026	2027	2027	2028	2028
8	Great Lakes Basin	2027	2028	2029	2030	2030

[a]In accordance with IDEM's rotating basin monitoring strategy, probabilistic monitoring is conducted in one major river basin each year so that comprehensive monitoring and assessments can be completed for the entire state

[b]All impairments identified through IDEM's rotating basin assessments are placed on Indiana's draft 303(d) List of Impaired Waters are made available for 90-day public comment period prior to submission of the 303(d) list to U.S. EPA. Because basin assessments made during a listing year occur after the draft 303(d) list is published for public comment, any impairments identified are held for the next listing cycle in order to ensure the public an opportunity for review and comment. Therefore, assessments made during a listing year are reported in the Integrated Report and placed on the draft 303(d) List of Impaired Waters during the next scheduled reporting cycle.

APPENDIX G:

IDEM'S 2020 CONSOLIDATED ASSESSMENT AND LISTING METHODOLOGY

APPENDIX G

IDEM'S 2020 CONSOLIDATED ASSESSMENT AND LISTING METHODOLOGY (CALM)

REGULATORY BACKGROUND

Section 305(b) of the 1972 Federal Clean Water Act (CWA) requires the U.S. Environmental Protection Agency (U.S. EPA) to provide a national water quality inventory report to Congress every two years. U.S. EPA develops its report with water quality assessment information provided, for the most part, by states through their water monitoring and assessment activities.

The Indiana Department of Environmental Management (IDEM) conducts water quality monitoring to meet a number of objectives, including to provide information to U.S. EPA for its national report. IDEM has developed this Consolidated Assessment and Listing Methodology (CALM) to guide its "305(b)" water quality assessment process. IDEM applies the decision-making processes described in the CALM to the available data to determine whether the waters monitored are meeting their designated uses identified in Indiana's water quality standards (WQS).

Waters that do not meet Indiana's WQS are considered impaired and placed on Indiana's "303(d) List of Impaired Waters" as required by Section 303(d) of the CWA. This section of the CWA requires that states identify waters impaired for one or more of their designated uses and to establish total maximum daily loads (TMDLs) necessary for the waterbody to meet the applicable WQS for the use(s) that are impaired.

U.S. EPA guidance recommends that states, territories, and authorized tribes submit an Integrated Water Quality Monitoring and Assessment Report (IR) that will satisfy the CWA requirements for both the Section 305(b) water quality report and Section 303(d) List of Impaired Waters. IDEM adopted this recommendation in 2002 and, since then, provides its biennial IR to US. EPA in even-numbered years.

IDEM'S SURFACE WATER QUALITY MONITORING STRATEGY

IDEM has developed a water quality monitoring strategy (WQMS) that guides both its surface water quality and ground water quality monitoring activities. The goals of the WQMS in collecting surface water quality, biological, and habitat data are to:

- Assess all waters of the state to determine if they are meeting their designated uses and to identify those waters that are not.
- Support Office of Water Quality (OWQ) programs, including WQS development, National Pollutant Discharge Elimination System (NPDES) permitting, and compliance.
- Support public health advisories and address emerging water quality issues.
- Support watershed planning and restoration activities.
- Determine water quality trends and evaluate performance of programs.
- Engage and support a volunteer monitoring network across the state.
- To achieve these goals, IDEM employs the following monitoring programs:
- Probabilistic monitoring in one basin per year on a nine-year rotating basin cycle.
- Trophic status monitoring of approximately 80 lakes each year by the Indiana University School of Public and Environmental Affairs (IU SPEA) Clean Lakes program.
- Fixed station monitoring at 165 sites across the state.
- Fish tissue and sediment contaminants monitoring on a five-year rotating basin cycle.
- Targeted (watershed characterization) monitoring for TMDL reassessments and development, watershed baseline planning, and performance measures determinations.

- Cyanobacteria monitoring of swimming beaches at 10-12 lakes in selected state parks and recreation areas.
- Thermal verification monitoring.
- Special sampling projects.
- Hoosier Riverwatch volunteer stream monitoring.

IDEM's 305(b) assessment and 303(d) listing processes follow a nine-year, rotating basin schedule (Table 1), which ensures that all basins in the state are assessed at least once every nine years (Figure 1) (IDEM, 2010).

Table 1: IDEM's 305(b) rotating basin monitoring, assessment, reporting and 303(d) listing schedule for aquatic life and recreational uses.

Sequence in IDEM's Rotating Basin Monitoring Strategy	Basin	Basin Monitored	Results for the Basin Assessed	Draft 303(d) List Published for Public Comment	Indiana's Integrated Report and 303(d) List Submitted to U.S. EPA

9	Ohio River Tributaries	2028	2029	2032	2032

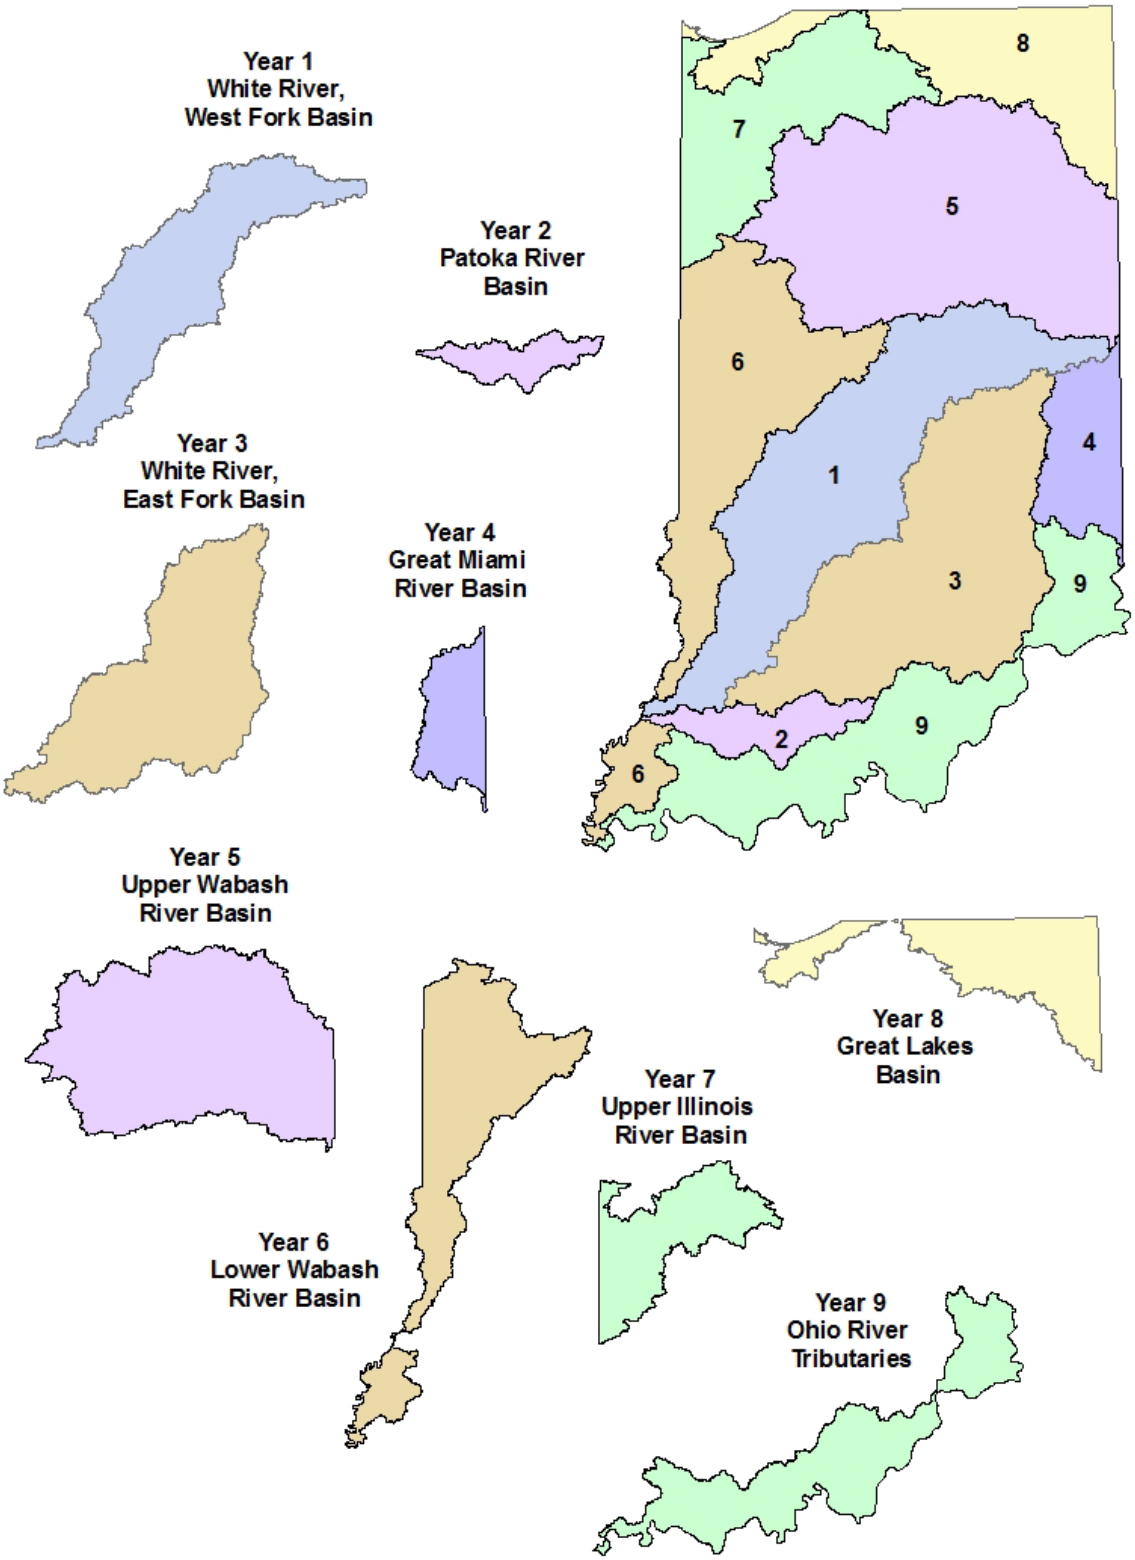

Figure 1: The nine major water management basins in Indiana as defined by IDEM to support the agency's rotating basin monitoring, assessment, reporting, and listing schedule.

Lakes and reservoirs in Indiana are monitored for IDEM by the Indiana Clean Lakes Program (CLP) administered by Indiana University's School of Public and Environmental Affairs. This monitoring does not follow the rotating basin due to the unequal distribution of lakes across the Indiana landscape. In 2010, The Indiana CLP began using a randomized approach to site selection with the goal of providing statistically significant lake water quality data that may eventually be applied to the entire state. From a universe of 320 lakes, 80 are chosen at random to be monitored each year.

WATERBODY ASSESSMENT UNITS

IDEM maintains its CWA Section 305(b) assessment and 303(d) listing information in U.S. EPA's Assessment, TMDL Tracking And Implementation System (ATTAINS) database. Each waterbody assessment unit (AU) is assigned a unique identifier in ATTAINS to which all assessment information for that waterbody is associated. This identifier is referred to as the assessment unit identifier (AUID).

In general, each AUID corresponds to the watershed in which it is located as defined by the United States Geological Survey (USGS) hydrologic unit code (HUC) system, which is a hierarchical system that divides and then subdivides the United States into successively smaller geographic areas based on surface hydrologic features or drainages. Under this system, the average size of an 8-digit hydrologic unit area in Indiana, commonly known as a subbasin, is about 448,000 acres (700 square miles). The 12- and 14-digit hydrologic unit areas, or subwatersheds, within an 8-digit hydrologic unit area are much smaller. The 12- and 14-digit hydrologic unit areas in Indiana range in size from less than five acres (less than one hundredth of a square mile) to about 28,000 acres (almost 44 square miles).

The geographical extent and location of each AU within a given 12- or 14-digit HUC are defined for mapping purposes through a process called reach indexing. Reach indexing uses software tools that work with geographical information system (GIS) applications to delineate for a waterbody one or more units of assessment and to "key" these AUs (as defined by IDEM) to the National Hydrography Dataset (NHD)[1]. This "key" is called the Reach Index. IDEM's Reach Index facilitates mapping of Indiana's 305(b) assessments and 303(d) listings in GIS applications, and then incorporates this information into U.S. EPA's Assessment, Total Maximum Daily Load (TMDL) Tracking and Implementation System (ATTAINS).

In these databases, Indiana lakes and reservoirs, including Lake Michigan, are assigned a single AUID with sizes reported in acres. Each lake in ATTAINS is presently associated with the 14-digit HUC in which it resides. As time allows, IDEM will begin associating lakes with their 12-digit HUC to better support IDEM's nonpoint source program, which has adopted the 12-digit HUC scale for watershed management planning and implementation purposes.

Indiana's Lake Michigan shoreline is divided into reaches and assigned an AUID in accordance with the 8-digit HUC in which each shoreline reach is located. The shoreline is measured and reported in miles.

[1] The NHD is a database created by the U.S. EPA and the United States Geological Survey that provides a comprehensive coverage of hydrographic data for the United States. It uniquely identifies and interconnects the stream segments that comprise the nation's surface water drainage system and contains information for other common surface waterbodies such as lakes, reservoirs, estuaries, and coastlines.

With the exception of the Ohio River whose AUIDs are likewise associated with their 8-digit HUCs, rivers and streams in IDEM's ADB are also divided into reaches with each one assigned a unique AUID in accordance with the 12-digit HUC in which it is located. River and stream reaches are measured in miles. Their sizes vary widely, and a single AU may or may not represent the entire stream to which it is associated.

The size of stream AUs is determined in large part by the hydrology of a system. This is because the mechanisms of large streams and rivers are very different from those of small streams and tributary systems thereby making it logical to separate these into individual AUs. Other factors, such as the following, are also considered when deciding how to define a water quality AU:

- Varying land uses within a watershed are considered because rural development can have different impacts on a stream than urban areas. This, in turn, has different impacts on a stream segment than do forested areas.
- The presence and locations of any permitted wastewater discharge facility is considered because the volume of its discharge can impact the hydrology of the receiving stream. The chemical makeup of its effluent can also impact water quality depending on the type of facility and whether the facility is operating effectively.
- IDEM also considers any other known factors that might reasonably be expected to impact hydrology or water quality, or both, such as the presence of dams and wetlands, and whether the stream has been channelized.
- Aerial photography provides additional information about the presence and thickness of riparian buffers, the presence and spatial extent of rural development, and the types of land use practices in the watershed.

All of these factors can help determine where differences in water quality might be expected to result. Due to the potential impacts these factors can have on stream water quality, they are all evaluated together when determining whether and where segmentation should occur along the stream reach.

DESIGNATED USES

The CWA provides the underpinning for Indiana's WQS, which are contained in Title 327, Article 2 of the Indiana Administrative Code (IAC) and are designed to ensure that all waters of the state, unless specifically exempted, are safe for full body contact recreation and are protective of aquatic life, wildlife, and human health. These uses are described in the state's WQS as "designated" uses. IDEM monitors and assesses Indiana's surface waters to determine the extent to which they meet WQS and support their designated uses and to identify, where possible, the sources of impairment for those waters that do not support one or more of these uses.

OVERVIEW OF IDEM'S WATER QUALITY ASSESSMENT PROCESSES

The designated uses outlined in Indiana's WQS and the narrative and numeric criteria to protect them provide the basis for IDEM's 305(b) assessment process and 303(d) listing decisions. Water quality assessments are made by compiling existing and readily available data from site-specific chemical (water, sediment, and fish tissue), physical (habitat and flow), biological (fish and macroinvertebrate communities), and bacteriological (*E. coli*) monitoring of Indiana's rivers, streams, and lakes and evaluating those data against Indiana's WQS. Waters identified as not meeting one or more of their designated uses are then placed on Indiana's 303(d) List of Impaired Waters. IDEM's decision-making criteria include a combination of the narrative and numeric criteria stated in Indiana's

WQS in 327 IAC 2.

Use support status is determined for each waterbody using the assessment guidelines provided in the U.S. EPA's documents regarding the 305(b) and 303(d) reporting methods outlined in the U.S. EPA "Guidance for 2004 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act" (U.S. EPA, 2003), and the additional guidance provided in the U.S. EPA's memorandums containing information concerning CWA Sections 303(d), 305(b), and 314 integrated reporting and listing decisions for the 2006, 2008, 2010, 2012, 2014, 2016, and 2018 cycles (U.S. EPA, 2005-2017). Available results from the following six types of monitoring data listed below are integrated to provide an assessment for each waterbody for 305(b) reporting and 303(d) listing purposes:

- Physical or chemical water results.
- Fish community assessment.
- Benthic aquatic macroinvertebrate community assessments.
- Fish tissue and contaminant results.
- Habitat evaluation.
- E. coli monitoring results.

The minimum data requirements for each type of assessment are provided in Table 2. For each AU with data meeting the minimum requirements for one or more designated uses, IDEM applies the assessment method for each use as described in later sections of this document. Assessment data are integrated for the purposes of making water quality assessments, meaning that all data for a given waterbody are considered together. In accordance with U.S. EPA policy, IDEM generally treats each type of data as independently applicable.

IDEM's methods for Ohio River Assessments, which are conducted in collaboration with the Ohio River Valley Sanitation Commission (ORSANCO) are covered in a separate section of this document. IDEM's CWA Section 314 assessments of lake trends and trophic state are also described in this document.

Table 2: Minimum data requirements for CWA assessments.

Parameter Type	Minimum Information Required for Assessment	Index Period
Aquatic Life Use Support – Rivers and Streams		
Toxicants	Minimum of three measurements	Most recent five consecutive years
Conventional Inorganics	Minimum of three measurements	Most recent five consecutive years
Nutrient Parameters	Minimum of three measurements and two or more of parameters must have been exceeded on same date in order to classify a waterbody as impaired.	Most recent five consecutive years
Benthic aquatic macroinvertebrate Index of Biotic Integrity (mIBI)	Minimum of one measurement, preferably with corresponding qualitative habitat use evaluation (QHEI) score*	Most recent five consecutive years
Fish community (IBI)	Minimum of one measurement, preferably with corresponding qualitative habitat use evaluation (QHEI) score*	Most recent five consecutive years
*The Qualitative Habitat Evaluation Index (QHEI) is not required to determine aquatic life use support but is used, when available, in conjunction with macroinvertebrate community scores (mIBI) or fish community scores (IBI), or both, to evaluate the role that habitat plays in waterbodies where biological integrity impairments have been identified.		
Fish Consumption Use Support (Human Health)		
PCBs in Fish Tissue	One actual concentration value for the site for a single species and size class	Most recent 12 consecutive years
Mercury in Fish Tissue	One trophic level weighted arithmetic mean concentration value calculated on all samples from the site from a single sampling event	Most recent 12 consecutive years
Recreational Use Support (Human Health) – All Waters		
Bacteria (E. *coli*)	Minimum of ten grab samples or one geometric mean result calculated from five equally-spaced samples over thirty days.	Most recent five consecutive years
Recreational Use Support (Aesthetics) – Lakes and Reservoirs		
Natural Lakes and Reservoirs	Minimum of three total phosphorus results with corresponding Chlorophyll *a* results collected over three years (consecutive or nonconsecutive). All readily available data for a given lake that meets IDEM's data quality requirements are evaluated for potential use in assessments.	
Public Water Supply Use Support – All Waters		
Chemical Toxicants	Minimum of three measurements collected within the same year at least one month apart	Most recent five consecutive years
Cyanobacterial Toxins	Minimum of one measurement Or One consumption and use notification issued by a water treatment facility based on cyanobacterial toxin concentrations in treated drinking water	Most recent five consecutive years
Conventional Inorganics	Minimum of three measurements collected within the same year at least one month apart	Most recent five consecutive years
Bacteria	All Level 1 or Level 2 assessments, or both, performed in accordance with the Revised Total Coliform Rule (RTCR)	Most recent five consecutive years

OHIO RIVER ASSESSMENTS

IDEM collaborates with the Ohio River Valley Water Sanitation Commission (ORSANCO) to conduct water quality assessments of the Ohio River reaches that border Indiana. ORSANCO is an interstate water pollution control agency for the Ohio River established through a compact agreement between member states and approved by Congress in 1948. The compact can be found online at: http://www.orsanco.org/orsanco-compact. Under the terms of this agreement, member states cooperate in the control of water pollution in the Ohio River Basin.

ORSANCO monitors the Ohio River on behalf of the compact states under CWA Section 305(b) and produces a water quality assessment report of its water quality condition every two years. Although this report identifies water quality issues on the Ohio River, ORSANCO, unlike its compact states, is not required to develop a 303(d) List of Impaired Waters. Identifying Ohio River impairments on a 303(d) list for the purposes of TMDL development is the responsibility of each compact state.

ORSANCO actively works with compact states to review its 305(b) assessment methodologies and revise them as needed. Every two years, ORSANCO prepares a description of the proposed assessment methodology for review by the 305(b) Work Group, which is made up of the state agency personnel responsible for preparing the Integrated Reports in each state and one or more U.S. EPA representatives responsible for reviewing state reports. At this time, provisional assessments based on proposed methods are also presented to the 305(b) Work Group for discussion. ORSANCO works with the 305(b) Work Group to achieve a consensus regarding its assessment methods and water quality assessments based on them. After ORSANCO's methodology and preliminary assessments are approved by the 305(b) Work Group, ORSANCO then presents them to its Technical Committee for final approval.

It is important to note that ORSANCO's assessment and reporting timeline does not correspond with IDEM's publication of its draft 303(d) list for public review and comment. ORSANCO's assessment methodology and its preliminary assessments for each cycle are always completed prior to or during IDEM's development of its draft 303(d) list for that cycle. However, they are considered provisional until presented to ORSANCO's Technical Committee for approval, which usually occurs after IDEM has published its draft 303(d) list for public comment.

In order to provide the public with the most current assessment information available for the Ohio River, IDEM includes ORSANCO's preliminary assessments and the methods upon which they are based in Indiana's draft 303(d) list and the CALM published each cycle. It should be understood, however, that ORSANCO's assessment methods as described in the CALM, along with any new Ohio River impairments added to or previously identified and removed from Indiana's draft 303(d) list, are provisional and may change based on approval of ORSANCO's Technical Committee.

ORSANCO's role in completing Ohio River use attainment assessments and developing a biennial report on Ohio River water quality conditions is primarily to facilitate interstate consistency in CWA 305(b) assessments and how impairments are identified on the compact states' 303(d) lists for the purposes of TMDL development. This consistency is not always possible given the differences in the compact states' WQS and their CWA Sections 305(b) and 303(d) assessment and listing methodologies. Given these differences, the compact states are not obligated to incorporate ORSANCO's water quality assessments into their own reports. U.S. EPA guidance states that "data and information in an interstate commission 305(b) report should be considered by the states as one source of readily available data and information when they prepare their Integrated Report and make decisions on segments to be placed in Category 5; however, data in a 305(b) Interstate Commission Report should not be automatically entered

in a state Integrated Report or 303(d) list without consideration by the state about whether such inclusion is appropriate." (U.S. EPA, 2005).

As Indiana is a member state of the Compact, IDEM actively participates in ORSANCO's decision-making processes regarding its monitoring strategy and biennial water quality assessments. Thus, those assessments that IDEM incorporates into its 303(d) list and the data upon which they are based have been reviewed by IDEM and are considered to be appropriate for use in the development of Indiana's 303(d) list.

Attachment A contains a comparison of the relative stringencies of applicable criteria in ORSANCO's Pollution Control Standards (PCS) and Indiana's WQS and the different ways in which these criteria are used to determine the degree to which the Ohio River supports aquatic life use, recreational use, and fish consumption. In order to achieve consistency with other compact states, IDEM generally accepts ORSANCO's methods for evaluating the available data for assessment purposes. And, where there are not significant differences between ORSANCO's criteria and those expressed in Indiana's WQS, IDEM incorporates ORSANCO's biennial assessments directly into its Integrated Report and 303(d) list, applying them to the corresponding reaches defined in ATTAINS. However, in cases where the water quality criteria ORSANCO uses are less stringent than the water quality criteria contained in Indiana's WQS, its methods for applying them are significantly inconsistent with IDEM's assessment methodology, or both situations exist, ORSANCO's data are evaluated against IDEM's assessment methodology. The results are then compared to Indiana's WQS to make the assessment. IDEM's methods for applying ORSANCO's assessments, data, or both for the purposes of Integrated Reporting are described below and summarized in Table 3.

IDEM's Assessment Units for the Ohio River

The Ohio River is a series of 20 pools resulting from a series of high-lift locks and dams that bisect the river. These dams were installed for navigational purposes to maintain a minimum river depth and to regulate flow. These pools range from around six to almost 130 miles long, and each has its own unique characteristics that can affect water quality. The beginning and end points of each pool are defined in terms of their Ohio River Miles (ORM). There are five pools located along Indiana's border:

- Markland Pool (ORM 491.1 to ORM 531.6)
- McAlpine (ORM 531.6 to ORM 609.4)
- Cannelton (ORM 609.4 to ORM 722.9)
- Newburgh (ORM 722.9 to ORM 853.5)
- JT Myers (ORM 853.5 to ORM 855.3)

For its aquatic life use and fish consumption, ORSANCO applies the results of its assessment to the entire pool from which the data were collected, while its recreational use support assessments are reported in terms of river miles. ORSANCO's assessments of public water supply are provided for the entire river as a whole.

IDEM has divided the Indiana reaches of the Ohio River into individual assessment units within each pool for the purposes of assessment. IDEM's assessment units range from 1.8-13.7 miles long and allow IDEM to more accurately apply ORSANCO's recreational use assessments to specific reaches within each pool. For aquatic life use and fish consumption, IDEM applies ORSANCO's results for each pool to all the IDEM assessment units within the pool. Attachment B provides a key showing how IDEM's assessment units correspond to the pools identified in ORSANCO's biennial assessments.

Aquatic Life Use Assessments for the Ohio River

ORSANCO monitors both the biological communities (fish and macroinvertebrates) and chemical water quality at several sites along the Ohio River to determine the degree to which the Ohio River supports aquatic life.

Physical and chemical water quality data are collected bimonthly from about 15 fixed sites along the Ohio River, most of which are located at the navigational dams that divide the river into pools, five of which are either partly or wholly located along Indiana's boarder. Biological monitoring is conducted in three to five pools each year at 15 randomly chosen sites in each pool, resulting in an assessment data set for the entire river every six years.

ORSANCO uses two biological indices specifically designed for the Ohio River, both of which induce different metrics to measure the condition of biological communities in the river. For fish community assessments of the Ohio River, ORSANCO uses the modified Ohio River Fish Index (mORFIn), which was developed based on the nationally-used Index of Biotic Integrity (IBI) designed to assess smaller streams. Both the mORFIn and the Ohio River Macroinvertebrate Index (ORMIn) have been customized to assess the Ohio River with expected values developed for the different habitats found in this large river system. These indices combine various attributes of the aquatic communities they measure to provide two scores for each pool in the river based on its biology. Individual mORFIn and ORMIn scores for each site are compared to their expected scores to determine the biological condition rating for each type of community, which ranges from excellent to very poor. For the purposes of assessment, ORSANCO calculates an average mORFIn and ORMIn scores for each pool based on the individual scores from all sites monitored within the pool.

ORSANCO determines chemical water quality conditions for each pool by comparing water sample results[2] for each site within the pool to the applicable criteria in Indiana's WQS or ORSANCO's PCS (Ohio River Valley Sanitation Commission, 2006), whichever are more stringent (CALM Attachment A). The results for biological and chemical water quality assessments are then evaluated together to determine use support in the manner described in Table 3.

IDEM accepts ORSANCO's approach to evaluating both biological and water chemistry data. However, because Indiana's water quality criteria differ for some parameters from ORSANCO's criteria, assessments reported in ORSANCO's 305(b) report may differ somewhat from those in Indiana's Integrated Report depending on the parameter in question and whether ORSANCO's or Indiana's criterion is more stringent.

[2] Dissolved oxygen and temperature results are also evaluated for exceedance(s) of the applicable criteria. However, these results are not used to make impairment decisions because the data are not considered representative of conditions throughout each pool or over the entire assessment period.

Recreational Use Assessments for the Ohio River

ORSANCO conducts at least five rounds of weekly sampling for bacteria at sites located upstream and downstream of six urban communities along the Ohio River. These are communities that have combined sewer overflows (CSOs), which can be significant sources of bacterial contamination to surface waters during wet weather events. Samples are analyzed for fecal coliform and Escherichia *coli* (E. *coli*). ORSANCO also monitors bacteria during the recreation season at five-mile intervals along the entire river. Sites are sampled weekly for a five-week period to allow for the calculation of a geometric mean for each site.

ORSANCO uses geometric mean E. *coli* results from all sites to determine recreational use support, comparing them to the E. *coli* criteria in ORSANCO's PCS. Indiana's E. *coli* criteria are slightly more stringent than ORSANCO's. However, in cases where there are at least ten samples at a given site, up to 10% of the results may exceed the single sample maximum criterion if the exceedances are incidental and attributable solely to the discharge of treated wastewater from a wastewater treatment and the geometric mean criterion is met3.

Unlike Indiana's WQS, ORSANCO's criteria do not allow exceptions for *E. coli* exceedances. This, combined with the fact that ORSANCO also directly applies its single sample maximum criterion to individual results, makes ORSANCO's recreational use assessments more stringent than Indiana's by virtue of its assessment methodology. Indiana, therefore, accepts ORSANCO's assessments of recreational use support for the Ohio River.

Public Water Supply Use Support Assessments for the Ohio River

To determine whether the Ohio River is meeting its use as a public water supply (PWS), ORSANCO combines the results from its bacteria monitoring and bimonthly chemical monitoring programs with information from surveys of drinking water treatment facilities and U.S. EPA's Safe Drinking Water Information System (SDWIS) database.

Each assessment cycle, ORSANCO mails surveys to all Ohio River water utilities requesting information about the quality of the source water they draw from the Ohio River. For Indiana, three facilities are contacted (Mt. Vernon, Evansville, and New Albany). The surveys ask utilities if there were any intake closures during the assessment period due to spills, whether violations of finished drinking water maximum contaminant levels (MCLs) occurred due to source water quality, or whether "non-routine" or extraordinary treatment due to source water quality was necessary to meet finished water MCLs.

ORSANCO also queries SDWIS for records of MCL violations within the assessment period for all Ohio River water utilities. For Indiana, this includes three facilities (Mt. Vernon, Evansville, and New Albany). This information is evaluated as shown in Table 3 to determine whether the Ohio River as a whole is meeting its use as a public water supply.

Fish Consumption Assessments for the Ohio River

In addition to its designated use support assessments for aquatic life, recreation, and public water supply, ORSANCO also conducts assessments to determine the degree to which the Ohio River supports fish consumption. In applying these assessments to Indiana reaches of the Ohio River, IDEM

[3] Relevant sections of the Indiana's water quality standards include 327 IAC 2-1.5-8(e)(3)(b) for waters within the Great Lakes basin and 327 IAC 2-1-6(d)(3), which applies to downstate waters.

emphasizes that this information is not intended to be a public health advisory. IDEM recommends that the public refer either to the most current Indiana Fish Consumption Advisory (FCA), contact the Indiana State Department of Health (ISDH), or consult both, with any specific questions or concerns regarding the health risks associated with consuming fish caught from the Ohio River. Important differences between fish consumption use impairments identified as a result of these assessments and the health advisories provided in the FCA are discussed in more detail in the section describing Indiana's assessment methodology for fish consumption for other Indiana waters and Lake Michigan.

ORSANCO uses both fish tissue data and water sample results to make its fish consumption use assessments, and its methods for evaluating the data differ somewhat from IDEM's methods for similar assessments on other Indiana waters. Unlike ORSANCO's methodology, IDEM's assessment methodology relies on fish tissue data only and requires only one exceedance of the applicable criterion to assess impairment. IDEM's methods are intended to result in a more conservative estimate of conditions in smaller rivers and streams for which there are commonly less available data.

In contrast, the Ohio River is a large and complex river system. The data provided for the assessment of fish consumption use support by ORSANCO monitoring programs result in a far more robust data set than those available for similar assessments of other Indiana waters. IDEM's collaboration with ORSANCO allows IDEM to focus its monitoring resources on other waters. As a result, IDEM's monitoring on the Ohio River is comparatively quite limited.

For most of the Ohio River, IDEM accepts ORSANCO's assessment methodology for fish consumption use support. Results for methylmercury and PCBs in fish tissue are reviewed independently of ORSANCO results using the same methods applied to other waters in the state for those reaches where IDEM has sampled for fish tissue. Where IDEM's assessment for a given reach differs from ORSANCO's assessment, IDEM accepts ORSANCO's assessment because it is typically based upon a more recent and robust data set.

In 2012, ORSANCO's Technical Committee approved the use of the U.S. EPA guidance issued in 2010 for implementing the national methylmercury water quality criterion in CWA programs and began using this methodology for its 2014 cycle assessments. The criteria ORSANCO applies in its fish consumption assessments are shown in Table 4. ORSANCO's criterion for methylmercury in fish tissue is equivalent to that used by IDEM in its fish consumption assessments on other waters.

In addition to fish tissue data, ORSANCO's monitoring programs provide results for PCBs, dioxin, and total mercury in the water column. For PCBs and dioxin, ORSANCO's criteria are more stringent than those contained in Indiana's WQS. For total mercury, Indiana's criterion is more stringent than ORSANCO's.

ORSANCO currently does monitor for PCBs in fish tissue. However, this sampling is conducted specifically to support the development of a fish consumption advisory for the Ohio River and as such, is heavily weighted toward trophic level 4 fish. IDEM is currently evaluating the representativeness of these data for the purposes of making CWA 305(b) assessments and exploring the possibility of working with ORSANCO to augment these results with additional sampling. With a more robust data set available for assessment, IDEM will apply its 0.02 µg/l fish tissue criterion for PCBs using ORSANCO's 10% rule as shown in Table 3 or if time allows, may explore new methods for the assessment of PCBs in fish tissue.

Table 3: Water quality assessment criteria for determining designated use support for the Ohio River.

<table>
<tr><th colspan="3">Aquatic Life Use Support – Ohio River</th></tr>
<tr><td colspan="3">ORSANCO combines the results from both its biological and chemical water quality monitoring programs to determine aquatic life use support for the Ohio River. To determine biological integrity of a given pool, average scores for the Ohio River modified Fish Index (mORFIn) and Ohio River Macroinvertebrate Index (ORMin) are calculated for each pool from the individual scores for all sites monitored within the pool and compared to expected scores to determine a biological rating for the pool. Chemical water quality conditions are determined for each pool by comparing water sample results[4] for each site within the pool to the applicable criteria in Indiana's WQS or ORSANCO's Pollution Control Standards (PCS) (Ohio River Valley Sanitation Commission, 2006), whichever are more stringent. The results for biological and chemical water quality assessments are evaluated together to determine use support in the manner described below.</td></tr>

Average mORFIn and/or ORMIn scores for the pool are less than 20, which indicates a biological rating of "Poor" to "Very Poor"</td></tr>
</table>

[4] Dissolved oxygen and temperature results are also evaluated for exceedance(s) of the applicable criteria. However, these results are not used to make impairment decisions because the data are not considered representative of conditions throughout each pool or over the entire assessment period.

Fish Consumption Use Support (Human Health) – Ohio River		
ORSANCO monitoring results for total mercury, PCBs, and dioxin in water samples were evaluated for the exceedance(s) of the applicable criteria in Indiana's WQS or ORSANCO's PCS, whichever is more stringent, and the number of times the exceedance(s) occurred. ORSANCO results for methylmercury in fish tissue samples were evaluated for the exceedance(s) of the applicable criteria in Indiana's WQS or ORSANCO's PCS, whichever is more stringent, and the number of times the exceedance(s) occurred. For sites where ORSANCO's water sample results conflict with its fish tissue results for the same pollutant, the fish tissue results are given more weight in the assessment decision. ORSANCO does not monitor for PCBs in fish tissue. ORSANCO uses a modified version that is a trophic level weighted arithmetic mean with trophic level 2 fish removed from the calculation. IDEM's methodology for assessing methylmercury in fish tissue is similar to ORSANCO's. However, based on ORSANCO's most robust data set for this large river, IDEM defers to ORSANCO's methodology for the assessment of fishable use support for the Ohio River. IDEM results for methylmercury and PCBs in fish tissue are reviewed independently of ORSANCO results using the same methods applied to other waters in the state. Where IDEM's assessment for a given reach differs from ORSANCO's assessment, IDEM accepts ORSANCO's assessment.		
	Fully Supporting	**Not Supporting**
Polychlorinated biphenyls (PCBs) and Dioxin in Water Samples	Not more than 10% of water sample results exceed the applicable water quality criterion	More than 10% of water sample results exceed the applicable water quality criterion
Polychlorinated biphenyls (PCBs) in Fish Tissue Samples	Actual concentration values for all samples are less than or equal to 0.02 mg/kg wet weight	Actual concentration values for one or more samples are greater than 0.02 mg/kg wet weight
Mercury in Fish Tissue and Water Samples	Trophic level weighted arithmetic mean concentration values for all sampling events are less than or equal to 0.3 mg/kg wet weight	Trophic level weighted arithmetic mean concentration values for one or more sampling events are greater than 0.3 mg/kg wet weight

Recreational Use Support (Human Health) – Ohio River		
Available data are evaluated in two ways. Both individual results and monthly geometric mean results calculated from five samples, one sample collected each week for five consecutive weeks, are evaluated for exceedances of the applicable criteria in ORSANCO's PCS and the number of times exceedances occurred.		
	Fully Supporting	**Not Supporting**
Bacteria (E. *coli*)	Not more than 10% of the monthly geometric mean results exceed the geometric mean criterion of 130 cfu/100mL And Not more than 10% of all single sample results exceed the instantaneous maximum criterion of 240 cfu/100 mL	More than 10% of the monthly geometric mean results exceed the geometric mean criterion of 130 cfu/100mL Or More than 10% of all single sample results exceed the instantaneous maximum criterion of 240 cfu/100 mL

Public Water Supply – Ohio River		
ORSANCO combines the results from its bacteria and chemical water quality monitoring programs with results from surveys of drinking water facilities and information from U.S. EPA's Safe Drinking Water Act Information System (SDWIS) to determine public water supply use support for the Ohio River.		
Chemical pollutants, bacteria, and information from surveys of drinking water facilities and SDWIS	Assessments of chemical water quality are based on results for bacteria (fecal coliform), conventional inorganics (fluoride, total nitrogen and nitrite, and sulfate) and other substances regulated under the SDWA with either a maximum concentration limit (MCL) or secondary MCL. These include total metals, total cyanide, and phenols. Results for bacteria and chemical pollutants are evaluated on a site-by-site basis. Exceedances are determined by comparing results for each site to the applicable criteria in Indiana's WQS or ORSANCO's PCS, whichever are more stringent.	
	Fully Supporting	**Not Supporting**
	Not more than 10% of water sample results exceed the applicable water quality criterion And No finished water MCL violations caused by Ohio River water quality were reported	More than 25% of water sample results exceed the applicable criterion Or More than 10% of water sample results exceed the applicable water quality and a corresponding finished water MCL violation caused by Ohio River water quality was reported Or Frequent closures due to elevated levels of pollutants were necessary to protect water supplies and meet MCLs Or Frequent "non-routine" additional treatment was necessary to protect water supplies and to meet MCLs
Pollutants	Actual concentration values for all samples are less than or equal to 0.02 mg/kg wet weight	Actual concentration values for one or more samples are greater than 0.02 mg/kg wet weight
Mercury in Fish Tissue and Water Samples	Trophic level weighted arithmetic mean concentration values for all sampling events are less than or equal to 0.3 mg/kg wet weight	Trophic level weighted arithmetic mean concentration values for one or more sampling events are greater than 0.3 mg/kg wet weight

With regard to mercury in the water column, ORSANCO's chronic aquatic life use criterion for total mercury in ambient waters is less stringent than the criterion used by Indiana downstate (outside of the Great Lakes basin). ORSANCO applies this criterion in its assessments of fish consumption use support as opposed to aquatic life use support because it considers bioaccumulation of mercury in fish tissue more of a human health concern than a threat to aquatic life. IDEM concurs with ORSANCO's use of water column results for mercury in assessments of fish consumption use based on this rationale and accepts ORSANCO's fish consumption use assessments for the Ohio River. Unlike ORSANCO, IDEM also applies the chronic criterion for total mercury in its assessments of aquatic life use support on the Ohio River. Based on Indiana's decision to use ORSANCO's total mercury results for aquatic life use assessments, Indiana's record of aquatic life use impairments may differ from those reported by ORSANCO in its biennial CWA 305(b) report.

For fish consumption assessments at sites where the results for total mercury or PCBs, or both, in water conflict with the fish tissue results for that same contaminant, the fish tissue results are given more weight in the assessment decision. This is because fish tissue levels of these contaminants are an indicator of more direct potential mercury exposure to individuals consuming fish from the Ohio River, whereas their concentrations in the water column are more of an indicator of potential bioaccumulation than direct impacts from consumption. IDEM concurs with this approach.

Table 4: Assessment criteria used by ORSANCO and IDEM to determine fish consumption use support for the Ohio River.

Mercury (Hg)		
	Fully Supporting	**Not Supporting**
Concentration in Fish Tissue	Less than or equal to 0.3 (mg/kg wet weight)	Greater than 0.3 (mg/kg wet weight)
Concentration in Water	Less than or equal to 0.012 µg/L	Greater than 0.012 µg/L
Polychlorinated Biphenyls (PCBs)		
	Fully Supporting	**Not Supporting**
Concentration in Fish Tissue	Less or equal to 0.02 (mg/kg wet weight)	Greater than 0.02 (mg/kg wet weight)
Concentration in Water	Less than or equal to 0.000064 µg/L	Greater than 0.000064 µg/L
Dioxin		
	Fully Supporting	**Not Supporting**
Concentration in Water	Less than or equal to 0.000000005 µg/L	Greater than 0.000000005 µg/L

AQUATIC LIFE USE ASSESSMENTS

Use Support Criteria for Biological Data

Biological assessments for streams are based on the sampling and evaluation of either the fish communities, or benthic aquatic macroinvertebrate communities, or both. The Index of Biotic Integrity (IBI) score for fish or the macroinvertebrate Index of Biotic Integrity (mIBI) score, or both, were calculated and compared to regionally-calibrated models. In evaluating fish communities, streams rating as "fair" or worse are classified as non-supporting for aquatic life uses. For benthic aquatic macroinvertebrate communities, individual sites are compared to a statewide calibration at the lowest practical level of identification for Indiana. All sites at or above background for the calibration are considered to be supporting aquatic life uses. Those sites rated as moderately or severely impaired in the calibration are considered to be non-supporting. Waters with identified impairments to one or more biological communities are considered not supporting aquatic life use. The process IDEM uses to make designated use support decisions is shown in Table 5. The biological thresholds upon which this process is based are shown in Table 6 to provide greater context for understanding the range of biological conditions that is considered either fully supporting or impaired.

IDEM's aquatic life use assessments are never based solely on habitat evaluations. However, habitat evaluations are used as supporting information in conjunction with biological data to determine aquatic life use support. Such evaluations, which take into consideration a variety of habitat characteristics as well as stream size, help IDEM to determine the extent to which habitat conditions may be influencing the ability of biological communities to thrive. If habitat is determined to be driving a biological integrity impairment and no other pollutants that might be contributing to the impairment have been identified, the biological integrity impairment is not considered for inclusion on IDEM's 303(d) List of Impaired Waters (Category 5). In such cases, the waterbody is instead placed in Category 4C for the biological impairment.

Table 5: Water quality assessment methodology for determining aquatic life use support.

Aquatic Life Use Support - Rivers and Streams		
Toxicants	Dissolved metals, pesticides, polychlorinated biphenyls (PCBs), polynuclear aromatic hydrocarbons (PAHs), free cyanide, and ammonia were evaluated on a site-by-site basis and judged according to the magnitude of the exceedance(s) of Indiana's WQS and the number of times the exceedance(s) occurred. For any one pollutant (grab or composite samples), the following assessment criteria are applied to data sets consisting of three or more measurements.	
	Fully Supporting	**Not Supporting**
	Not more than one exceedance of the acute or chronic criteria for aquatic life within a three year period[5].	More than one exceedance of the acute or chronic criteria for aquatic life within a three year period.
Conventional inorganics	Dissolved oxygen, pH, sulfate, and chloride were evaluated for the exceedance(s) of Indiana's WQS. For any one pollutant, the following assessment criteria are applied to data sets consisting of three or more measurements.	
	Fully Supporting	**Not Supporting**
	Criteria are exceeded in less than or equal to 10% of measurements.	Criteria are exceeded in greater than 10% of measurements.
Nutrients	Nutrient conditions were evaluated on a site-by-site basis using the benchmarks described below. In most cases, two or more of these conditions must be met on the same date in order to classify a waterbody as impaired. This methodology assumes a minimum of three sampling events: o Total Phosphorus -- One or more measurements greater than 0.3 mg/L o Nitrogen (measured as Nitrate + Nitrite) – One or more measurements greater than 10.0 mg/L o Dissolved Oxygen – One or more measurements below the water quality standard of 4.0 mg/L or measurements that are consistently at or close to the standard, in the range of 4.0-5.0 mg/L, and/or one or more saturation values greater than 120% o pH measurements – One or more measurements exceed the water quality standard of not more than 9.0 pH units or measurements are consistently at or close to the standard, in the range of 8.7- 9.0 pH units o Algal Conditions -- Algae are described as "excessive" based on field observations by IDEM scientists.	
Benthic aquatic macroinvertebrate Index of Biotic Integrity (mIBI) Scores (Range of possible scores is 12-60)	**Fully Supporting**	**Not Supporting**
	mIBI greater than or equal to 36	mIBI less than 36
Fish community (IBI) Scores (Range of possible scores is 0-60)	IBI greater than or equal to 36	IBI less than 36

[5] For Indiana waters within the Great Lakes Basin, acute aquatic criteria refer to the "criterion maximum concentration" (CMC) identified in 327 IAC 2-1.5, and the chronic aquatic criteria refer to the "criterion continuous concentration" (CCC) also described therein. For downstate waters (those located outside of the Great Lakes Basin) the acute aquatic criteria refer to the "AAC" values shown in 327 IAC 2-1 and the chronic aquatic criteria are shown as the "CAC" values.

Aquatic Life Use Support – Rivers and Streams	
Qualitative habitat use evaluation (QHEI) (Range of possible scores is 0-100)	The Qualitative Habitat Evaluation Index (QHEI) is not used to determine aquatic life- use support. Rather, the QHEI is an index designed to evaluate the lotic habitat quality important to aquatic communities and is used in conjunction with mIBI or IBI data, or both, to evaluate the role that habitat plays in waterbodies where biological integrity impairments have been identified. QHEI scores are calculated using six metrics: substrate, instream cover, channel morphology, riparian zone, pool/riffle quality, and gradient. A higher QHEI score represents a more diverse habitat for colonization of aquatic organisms. IDEM has determined that a QHEI total score of <51 indicates poor habitat. For streams where the macroinvertebrate mIBI or IBI scores indicate the biological integrity of the waterbody is impaired, QHEI scores are evaluated to determine if habitat is the primary stressor on the aquatic communities, or if there may be other stressors/pollutants causing the biological integrity impairment.

Table 6: Biological thresholds upon which IDEM's assessment method for aquatic life use support is based.

Biotic Index Score and Associated Assessment Decision	Integrity Class	Corresponding Integrity Class Score	Attributes
Macroinvertebrate Community Data Collected With Artificial Samplers (used in assessments prior to 2010 cycle)			
mIBI greater than or equal to 1.8 (artificial substrate sampler) indicates full support	Excellent	6.0-8.0	NA
	Good	4.0-5.9	NA
	Fair	1.8-3.9	NA
mIBI less than 1.8 (artificial substrate sampler) indicates impairment	Poor	1.0-1.7	NA
	Very Poor	0-0.9	NA
Macroinvertebrate Community Data Collected Using Kick Methods (used in assessments prior to 2010 cycle)			
mIBI greater than or equal to 2.2 (kick methods) indicates full support	Excellent	6.0-8.0	NA
	Good	4.0-5.9	NA
	Fair	2.2-3.9	NA
mIBI less than 2.2 (kick methods) indicates impairment	Poor	1.0-2.1	NA
	Very Poor	0-0.9	NA
Macroinvertebrate community data collected using multihabitat (mHAB) methods (used in assessments from the 2010 cycle to present)			
mIBI greater than or equal to 36 indicates full support	Excellent	53-60	Comparable to "least impacted" conditions, exceptional assemblage of species.
	Good	45-52	Decreased species richness (intolerant species in particular), sensitive species present.

Biotic Index Score and Associated Assessment Decision	Integrity Class	Corresponding Integrity Class Score	Attributes
	Fair	36-44	Intolerant and sensitive species absent, skewed trophic structure.
mIBI less than 36 indicates impairment	Poor	23-35	Many expected species absent or rare, tolerant species dominant.
	Very Poor	13-22	Few species and individuals present, tolerant species dominant
	No Organisms	12	No macroinvertebrates captured during sampling.
Fish Community Data			
IBI greater than or equal to 36 indicates full support	Excellent	53-60	Comparable to "least impacted" conditions, exceptional assemblage of species.
	Good	45-52	Decreased species richness (intolerant species in particular), sensitive species present.
	Fair	36-44	Intolerant and sensitive species absent, skewed trophic structure.
IBI less than 36 indicates impairment	Poor	23-35	Top carnivores and many expected species absent or rare, omnivores and tolerant species dominant.
	Very Poor	1-22	Few species and individuals present, tolerant species dominant, diseased fish frequent.
	No Organisms	0	No fish captured during sampling.

Revisions to IDEM's Use Support Criteria for Biological Data

IDEM's use support criteria for fish community and macroinvertebrate community data have undergone significant changes since they were first adopted in 1996. Table 7 summarizes the evolution of IDEM's criteria for making assessments with biological data.

The biological criteria that were developed for both fish and macroinvertebrate communities for the 2004 305(b) and 303(d) assessment and listing cycle were calibrated to reference conditions throughout Indiana and applicable to all waters. However, the resulting criteria were applied only to the basins being assessed at the time. For the 2006 cycle, IDEM began reviewing all aquatic life use support assessments made in the remaining basins throughout the state prior to 2002 to ensure their consistency with the statewide criteria developed in 2004. This review was completed for the 2008 cycle.

Although the fish community criteria developed in 2004 remain in effect today, IDEM revised its assessment methods for evaluating macroinvertebrate data for the 2010 cycle.

The statewide mIBI developed for the 2004 cycle was based on riffle/run samples collected throughout the state from 1990 through 1994. The Office of Water Quality (OWQ) used the riffle/run method from 1996 through 2003, collecting samples at some of the same sites sampled for the original

calibration of the index that were randomly selected for follow-up sampling. Beginning in 1998, the OWQ also collected samples at probabilistic sites chosen for the Watershed Monitoring Program where a suitable riffle/run habitat was present. Unfortunately, less than half of the probabilistic sites sampled during this time had riffle/run type habitats within the allowed distance, which reduced the effectiveness of the riffle/run method as a monitoring tool. This necessitated the development of a macroinvertebrate sampling method which could be used at all probabilistic sites, regardless of habitat.

The new multi-habitat method (mHAB) mIBI differs primarily from the riffle/run method in that it samples all habitats available at a stream site using a D-frame net instead of the kick screen used in the riffle/run method. In 2004, 62 sites (a subset selected from all sites previously sampled with the riffle/run method between 1990 and 2003) were re-sampled with the new mHAB method. The idea was to develop an index calibrated not on the best possible reference conditions but on a normal distribution of stream conditions based on mIBI scores obtained at previously sampled sites. It was later determined that this was too few samples to develop a statewide index; therefore, these samples were combined with probabilistic samples collected in 2005, 2006, and 2007 (a total of 247 samples) to develop the index currently in use.

Twelve metrics were chosen from a pool of more than 100 possible metrics in the development of the new mIBI. These 12 metrics provided the best correlation to the data and describe a diversity of features that characterize the quality of a stream or river. The scores for each individual metric are totaled and can range from 12 to 60. As with the fish community IBI, mIBI scores less than 36 are considered non-supporting of aquatic life use while those greater than or equal to 36 are supporting of aquatic life use.

Table 7: Evolution of the criteria used in making aquatic life use assessments with biological data.

Cycle	Criteria Development and Changes
1998	IDEM used Karr's 1986 Index of Biotic Integrity (IBI) Classification and Attributes Table to establish criteria to apply to fish community (IBI) data for use support assessments: ○ IBI greater than or equal to 44 = Fully supporting (Excellent/Good) ○ IBI between 44 and 22 = Partially supporting (Fair/Poor) ○ IBI less than 22 = Not supporting (Very Poor/No Fish) IDEM's criteria for macroinvertebrate community (mIBI) data collected using kick methods: ○ mIBI greater than or equal to 4 = Fully supporting ○ mIBI between 4 and 2 = Partially supporting ○ mIBI less than 2 = Not supporting
2000	IDEM reviewed fish community data from 1990-1995 (a total of 831 samples) to determine new, more accurate limits reflective of Indiana fish communities by subtracting ½ standard deviation from the statewide mean to calculate the following criteria: ○ IBI greater than or equal to 34 = Fully supporting ○ IBI between 34 and 32 = Partially supporting ○ IBI less than 32 = Not supporting Criteria for macroinvertebrate community data were unchanged.
2002	Based on IDEM's adoption of the U.S. EPA's integrated reporting format, the category for partially supporting was eliminated for both fish community data and macroinvertebrate community data: ○ IBI greater than or equal to 32 = Fully supporting ○ IBI less than 32 = Not supporting Criteria for macroinvertebrate community data were unchanged.
2004 to 2008	IDEM completes its first five-year basin monitoring rotation. After reviewing the narrative aquatic life use criteria and definitions of a well-balanced aquatic community in Indiana's water quality standards (327 IAC 2-1 and 327 IAC 2-1.5), IDEM determined that IBI values previously considered partially supporting are reflective of poorer conditions and should be classified as not supporting. The resulting criteria were applied to all basins in Indiana: ○ IBI greater than or equal to 36 = Fully supporting ○ IBI less than 36 = Not supporting With a more robust set of macroinvertebrate community data, IDEM was also able to calibrate its criteria for this type of data, developing specific criteria applicable to all basins in the state. For samples collected with an artificial substrate sampler: ○ mIBI greater than or equal to 1.8 = Fully supporting ○ mIBI less than 1.8 = Not supporting For samples collected using kick methods: ○ mIBI greater than or equal to 2.2 = Fully supporting ○ mIBI less than 2.2 = Not supporting
2010 to present	Criteria for fish community data remain unchanged. IDEM developed a new mIBI using mHAB sampling methods that accounts for all habitat types available at a given site and that is applicable in all basins in the state. All samples are collected using a D-frame net, and mIBI scores range from 12-60: ○ mIBI greater than or equal to 36 = Fully supporting ○ mIBI less than 36 = Not supporting

FISH CONSUMPTION SUPPORT ASSESSMENTS

The U.S. EPA "generally believes that fish and shellfish consumption advisories based on reach specific information demonstrate impairment of CWA section 101(s) 'fishable' uses" and continues to require that IDEM make water quality assessments for fish consumption and place waters with fish consumption advisories on its 303(d) list of impaired waters (U.S. EPA, 2000a). However, Indiana's WQS do not contain numeric criteria for the concentration of mercury or polychlorinated biphenyls (PCBs) in fish tissue. IDEM's past and present fish consumption use assessments are a translation of the

narrative portion of Indiana's WQS, which states that surface waters "…shall be free from substances in concentrations that on the basis of available scientific data are believed to be sufficient to injure, be chronically toxic to, or be carcinogenic, mutagenic, or teratogenic to humans, animals, aquatic life, or plants." (327 IAC 2-1-6 (a)(2) and 327 IAC 2-1.5-8(b)(2)).

Mercury

In 2001, the U.S. EPA issued a revised human health-based water quality criterion for methylmercury (U.S. EPA 2001). This criterion was unique among all U.S. EPA (Clean Water Act 304(a)) water quality criteria in that it identifies an acceptable mercury concentration in fish tissue rather than water. A fish tissue criterion is logical because fish are the main source of methylmercury exposure to both humans and wildlife. Also, a tissue-based criterion eliminates the need for a bioaccumulation factor in the criterion calculation, which can be a significant source of uncertainty. The derivation of the methylmercury water quality criterion is based on the reference dose of 0.1 µg/kg body weight/day, exposure data (for example, the amount of methylmercury ingested, inhaled, or absorbed per day), and data about the target population to be protected. The U.S. EPA criterion (U.S. EPA 2001) is 0.3 mg/kg wet weight methylmercury in fish muscle tissue. Since nearly 100 percent of the mercury in fish muscle is methylmercury, the criterion can reasonably be considered a total mercury criterion.

Polychlorinated Biphenyls (PCBs)

The U.S. EPA has not issued a human health-based criterion for PCBs in fish tissue, and Indiana's WQS do not contain a numeric concentration criterion for PCBs in the edible portion of fish tissue. However, Indiana has adopted human health WQS to protect the public from adverse impacts due to:

(1) exposure through public drinking water supplies withdrawn from surface waters; and

(2) nondrinking water exposures, such as consumption of fish caught in Indiana lakes, rivers, and streams.

Although human consumption of sport fish is not explicitly described in Indiana's WQS, fish consumption values are included as part of the calculation of the human health criteria intended to ensure that the levels of a carcinogenic chemical in fish are not at levels harmful to people who consume them.

Without a U.S. EPA criterion derived specifically for fish tissue concentration of PCBs, using the U.S. EPA's methodology for deriving ambient water quality criteria for the protection of human health (U.S. EPA 2000b) to calculate a concentration value for PCBs is a reasonable alternative that results in a criterion that is more readily applicable to Sections 305(b) and 303(d) water quality assessments than using FCA grouping levels. IDEM's benchmark criteria for mercury and PCBs in fish tissue are shown in Table 8.

Table 8: WQS-based assessment thresholds for mercury and PCBs.

Mercury (Hg)		
Concentration in Fish Tissue	**Fully Supporting**	**Not Supporting**
	Less than or equal to 0.3 (mg/kg wet weight)	Greater than 0.3 (mg/kg wet weight)
Polychlorinated Biphenyls (PCBs)		
Concentration in Fish Tissue	**Fully Supporting**	**Not Supporting**
	Less than or equal to 0.02 (mg/kg wet weight)	Greater than 0.02 (mg/kg wet weight)

Relationship of IDEM's WQS-Based Criteria to the FCA

Fish consumption advisories (FCAs) are determined based on the quantity of a chemical in fish, such as milligrams of chemical per kilogram of the edible portion of fish tissue (mg/kg). WQS, on the other hand, are expressed as the quantity of the chemical in water, such as micrograms of a chemical per liter of water (µg/L). The exposure assumptions upon which the human health criteria are based can be used to calculate a maximum safe fish concentration. That fish concentration value can then be directly compared to the values used to issue fish consumption advisories to determine whether the advisory is less or more protective than the WQS.

The levels of fish tissue contaminants that trigger a FCA and the levels of fish tissue contaminants on which the WQS criteria are based are derived using the same contaminant result, reference dose, and assumptions about the body weight of those consuming the fish. Although EPA derived its recommended screening value for a fish advisory limit for mercury and human health methylmercury criterion from virtually identical methodologies, it is important to clarify the distinctions between the two values. They are consistently derived, but, because the two values differ in purpose and scope, they diverge at the risk management level. Fish advisories are intended to inform the public about how much consumers should limit their intake of individual fish species from certain waterbodies. In contrast, the human health criterion is used as the basis for non-regulatory and regulatory decisions. The criterion serves as guidance for use in establishing WQS, which, in turn, serve as a benchmark for attainment, compliance, and enforcement purposes.

FCAs are intended to provide for the protection of human health over a lifetime of exposure, maximizing the benefits of eating fish while minimizing the risk. The calculations used to determine if a FCA should be issued are based on the contaminant concentration found in fish, which is treated as a constant while consumption rates are allowed to vary (how much fish a person can safely consume without exceeding a particular dose rate). Allowing for different consumption rates makes it possible to safely consume fish that have different levels of contamination. The recommended consumption rate is reduced as fish tissue contaminant concentrations increase. In contrast, WQS criteria calculations start with an assumed level of fish consumption and derive a criterion for a safe level of exposure to the contaminant in the fish for those who consume them. Because the consumption rate is held constant, the resulting criterion can be applied consistently to all waters. FCAs are expressed for a given waterbody in terms of certain species within certain size ranges. Very few FCAs apply to all fish in a given waterbody, which limits their utility for water quality assessment purposes.

IDEM's assessment methodology for evaluating fish tissue data is directly applicable to all waters and uses the revised human health-based water quality criterion for methylmercury (U.S. EPA 2001) and a criterion for PCBs derived from the U.S. EPA's (2000b) human health methodology.

While mindful of the differences in purpose and function of the FCA and the 303(d) list, IDEM's methodology maintains as much consistency as possible between the protocols that ISDH, IDEM, and the Indiana Department of Natural Resources use to assess data for the FCA and the protocols that IDEM uses to assess data for the determination of impairment. For PCBs, the WQS-based threshold is lower than the FCA threshold for a Group 2 advisory. Therefore, there is a concentration range where there could be a WQS exceedance but still unlimited consumption. However, the threshold for mercury is higher than that which would trigger a Group 2 advisory (Table 9). For mercury, given the existing exposure assumptions upon which the water quality criteria are based, issuance of a FCA does not necessarily indicate an exceedance of WQS.

Table 9: Fish tissue concentrations for levels of consumption advice protective of sensitive populations established by ISDH for mercury and total PCBs and its correspondence to an impairment condition as determine by the WQS criteria. Sensitive populations include pregnant or nursing women, women that will become pregnant, and children under 6 years of age.

Mercury	Fish Tissue Concentration (mg/kg)				
	Less than 0.05	0.05 – 0.2	0.2 – 1.0	1.0 – 1.9	Greater than 1.9
FCA Groups	Group 1	Group 2	Group 3	Group 4	Group 5
Consumption Advice (FCA)	unlimited	1 meal per week	1 meal per month	1 meal every 2 months	No consumption
PCBs	**Fish Tissue Concentration (mg/kg)**				
	Less than 0.05	0.05 – 0.2	0.2 – 1.0	1.0 – 1.9	Greater than 1.9
FCA Groups	Group 1	Group 2	Group 3	Group 4	Group 5
Consumption Advice (FCA)	unlimited	1 meal per week	1 meal per month	1 meal every 2 months	No consumption

*Shaded cells indicate consumption advice that corresponds to nonsupport and an impaired condition using the WQS-based criteria.

The consumption rates expressed in Indiana's WQS for human health are 15.0 g/day for waters in the Great Lakes basin (327 IAC 2-1.5-14) and 6.5 g/day for downstate waters (327 IAC 2-1-8.6). For mercury, IDEM defaulted to the U.S. EPA water quality criterion 0.3 mg/kg methylmercury wet weight determined at a consumption rate of 17.5 g/day for mercury in fish tissue and a reference dose of 0.1 µg/kg body weight/day (U.S. EPA, 2001).

For calculating the criterion for PCB in fish tissue, IDEM used the same consumption rate the U.S. EPA used to calculate its criterion for mercury in fish tissue for the general population, which is 17.5 g/day national consumption rate. The use of a higher consumption rate in the PCB calculation is consistent with that used by the U.S. EPA and results in a more protective criterion than applying the consumption rate expressed for either the Great Lakes basin or downstate waters. The same holds true

for mercury. IDEM's decision to use the U.S. EPA's criterion value for mercury in fish tissue was a policy decision based on the fact that the U.S. EPA's criterion is more protective. Calculations for both criteria are provided in Attachment C.

Assessment method using the WQS-based criteria

IDEM's assessment methodology for evaluating fish tissue data is summarized in Table 10, and reflects a conservative approach intended to both identify waters in which the data indicate impairment for mercury or PCBs, or both, and to provide for the protection of human health.

Table 10: Water quality assessment methodology for determining fish consumption use support.

Fish Consumption Use Support (Human Health) – All Waters		
Available fish tissue data for the most recent 12 years of data collection are evaluated. Only waters for which sufficient fish tissue data were available were assessed for fish consumption. All results from sampling locations considered representative of a given assessment unit (lake or reservoir; stream or stream reach) must be below the benchmarks for mercury and PCBs in order to be assessed as fully-supporting. For mercury, all waters with a trophic level weighted arithmetic mean result (calculated with all the samples collected during the same sampling event) that exceeds the applicable benchmark are classified as impaired. For PCBs, all waters with a single sample result for a given species exceeding the applicable benchmark are classified as impaired.		
Mercury in Fish Tissue	**Fully Supporting**	**Not Supporting**
	Trophic level weighted arithmetic mean concentration values for all sampling events are less than or equal to 0.3 mg/kg wet weight	Trophic level weighted arithmetic mean concentration values for one or more sampling events are greater than 0.3 mg/kg wet weight
PCBs in Fish Tissue	**Fully Supporting**	**Not Supporting**
	Actual concentration values for all samples are less than or equal to 0.02 mg/kg wet weight	Actual concentration values for one or more samples are greater than 0.02 mg/kg wet weight

For PCBs, all samples from a given sampling reach must have results below the benchmark for PCBs in order to be assessed as fully supporting, and all waters with a sample result exceeding the benchmark are classified as impaired. This is a highly conservative approach that considers only the highest sample PCB concentration, which may be one of a number of samples collected at the site.

For mercury, IDEM calculates a single, trophic level, consumption rate-weighted, arithmetic mean result for the site based on all the samples collected during a given sampling event. This result is then compared to the criteria to determine use support. All waters with a trophic level, consumption rate-weighted, arithmetic mean result exceeding the benchmark are classified as impaired. The calculation IDEM uses provided in Attachment C apportions the national default consumption rate of 17.5 g/day across three trophic levels based on the amount and type of fish (by trophic level) that people might be consuming and, as such, more accurately characterizes human exposure and, therefore, fishable use support.

Sport fish are of particular importance to the question of consumption because they comprise the majority of fish taken by anglers. Most sport fish are predator species but also include omnivores such as carp. Therefore, to properly determine the degree to which a waterbody supports fish consumption, an appropriate methodology takes into consideration both the types of fish being caught and how differences in species affect the concentrations of the contaminant in question.

The differences in IDEM's assessment methods for PCBs and mercury are a function of how these contaminants accumulate in the tissues of fish when the fish ingest them. PCB concentrations in fish are primarily a function of their fat content while mercury concentrations are more a function of their trophic level. Because PCBs accumulate in the fatty tissues of fish, concentrations tend to be higher in more fatty species such as carp and catfish as opposed to species such as bass and sunfish, which are leaner by comparison. In contrast, mercury tends to be higher in predator species because it bio-accumulates up the food chain as larger fish consume smaller fish containing mercury.

The method of calculating a trophic level-weighted, arithmetic mean for mercury is not appropriate for PCBs because trophic levels are less predictive than individual species of PCB concentrations in fish caught at a given site. As a result, trophic levels are less representative of the amount of PCBs a person might consume.

Based on the way that PCBs bioaccumulate in fish tissue (by accumulating in their fatty tissue), IDEM continues to use the results of individual samples for the purposes of assessment, and the type of fish species continues to be a factor in assessment. Based on the U.S. EPA's 2010 guidance, the particular species is no longer as relevant for evaluating total mercury concentration (most of which is methylmercury) in fish tissue, which is more a function of trophic level for determining fish consumption use support. For evaluating mercury in fish tissue, IDEM uses a trophic level, geometric mean to calculate a consumption-weighted, arithmetic mean for the site, which considers consumption levels across all trophic levels and includes all species types. IDEM's process for determining fish consumption use support is described in more detail in the following steps.

Step 1. Determine adequate data for assessment

The adequacy of a data set for the purposes of making a 305(b) assessment is determined by the analytical quality of the data set as well as the amount and age of the data. All of these factors can affect the degree to which the data accurately represent waterbody conditions.

One sampling event is considered sufficient for assessment purposes. At a given sampling event, composite samples are made for each species within a given size class collected at the site, which provides one or more species-specific results for assessment. For PCBs, results for each individual sample are compared to the 0.02 mg/kg criterion to make the assessment. For mercury, a consumption-weighted, arithmetic mean is calculated for each sampling event using the results from all the samples collected. The arithmetic mean result for each sampling event is treated as an individual result and compared to the 0.3 mg/kg criterion. Multiple sampling events within a single year or multiple years for a site are not pooled together for either mercury or PCB assessments.

U.S. EPA guidance suggests that, while all readily available data should be reviewed, 305(b) assessment decisions should be based on data five or fewer years old. However, IDEM has established 12 years as the appropriate index period for the purposes of evaluating fish tissue data. Given the persistent nature of fish tissue contaminants in the environment, aggregating data over several years minimizes the effects of temporal, spatial, and species-level variability on the assessment process. Based on IDEM's sampling strategy, an index period of 12 years ensures two full cycles of fish tissue data for use in evaluating fish consumption use support.

Each contaminant is assessed independently. Therefore, the use is considered impaired, and the waterbody is listed if *either* mercury or PCBs in fish tissue fails to meet the corresponding benchmark for full support. Independent applicability is also applied to all results obtained within the index period

for assessment. By definition, the index period is the period of time over which the data may reasonably be considered representative of conditions in a given waterbody. A single, older result collected within the index period may well be representative of the variability within the waterbody and is considered equally valid as any other sample collected in the same index period.

Therefore, where there are conflicting results from samples collected within the index period, the waterbody is assessed as impaired regardless of when in the index period the exceeding results were collected and even if the more recent results indicate full support.

Step 2: Apply WQS-based concentration thresholds to determine use support

The WQS-based assessment thresholds shown in Table 8 were applied to all lakes and streams for which sufficient fish tissue data were available. IDEM's methods for applying these criteria are summarized in Table 10. All waters found to be not supporting due to either mercury or PCBs, or both, are categorized as impaired and placed in Category 5B of Indiana 303(d) List of Impaired Waters.

Step 3: Determine the appropriate geographical extent to which the assessment applies

In some cases, fish can be very mobile and difficult to attribute to a discrete portion of a lake or river reach. In determining the appropriate geographical extent to which results can be confidently applied, IDEM follows the general rules described below. Unless otherwise stated, the same general rules are applied to assessments of both PCBs and mercury in fish tissue.

Stream Order Considerations

For flowing waters, stream order is the primary factor considered in determining the appropriate distance over which the results should be applied. Stream order is a good indicator of relative stream size, and, to the extent that size affects flow, the size of a given stream has a significant effect on species and sizes of fish that might be caught there.

Generally, in cases where significant differences in stream order exist in a given watershed, results are applied only to the stream on which they were obtained. This is because the fish community found in a third or fourth order stream might reasonably be expected to be very different from the fish communities found in its first and second order tributaries. Likewise, the expectations for the type and sizes of fish found in a fifth order stream would be different from those for a third or fourth order stream. Given this, results obtained from fifth order and greater streams are limited only to the mainstem and are not considered representative of their tributaries. Because of the significant effects that stream order has on the structure of the fish community in a given stream, basing extrapolations primarily on stream order allows us to more reliably apply fish tissue results on a stream-specific basis.

Most of Indiana’s larger streams and rivers (third, fourth, and fifth order streams) have been monitored for many years, resulting in very robust data sets. On these streams, results are applied to greater lengths where upstream and downstream samples were available.

Results for many of Indiana’s smaller streams (first and second order streams) are generally more limited. On these waters, results are applied only to the 12-digit watershed boundary except in cases where additional results from sites in an upstream or downstream watershed support assessment over a greater distance. In these cases, assessments are limited to mainstem reaches between the sites and are not applied to their tributaries. Results from a mainstem site are also applied to its headwaters if obtained in the same watershed or the watershed immediately downstream.

The Consideration of Background Conditions in Assessments

For PCBs, relative concentrations are used as an indicator of background conditions. Values greater than 1,000 ppb for PCBs are considered suggestive of point sources, most of which are known legacy sources of this contaminant. Values lower than this can be reasonably attributed to atmospheric and biological redistribution of contaminants or low level nonpoint sources and are considered representative of background conditions. Therefore, for PCBs, monitoring results in a smaller watershed are also extrapolated into other streams of similar stream order in that watershed when values are consistently low such as to suggest background conditions. In cases where the sampling site is located in a particularly large or hydrologically-complex watershed or far upstream from most or all streams in the watershed, extrapolations are more limited. Extrapolations around sites with very high PCB concentrations suggesting point sources are also limited.

Atmospheric deposition from local and regional sources is the primary cause of mercury in waterbodies. While mercury is a naturally occurring element in the environment, scientific evidence suggests that human activities may be increasing the levels of mercury released into the atmosphere (Risch and Fredericksen, 2015).

Unlike PCBs, there is no concentration value for mercury that is considered particularly suggestive of point sources. High mercury values in fish tissue are more indicative of localized methylation processes affecting the amount of mercury available for uptake than any sources of contamination. Background conditions for mercury in fish tissue are very difficult to determine because they are highly dependent on the structure of the fish community, which differs significantly depending on the size of the stream in question. While it may be possible to predict background conditions for a given stream order to guide extrapolations of results for mercury in fish tissue, stream order itself remains a more reliable indicator of the extent to which those results may be representative for the purpose of determining use support.

Additional Factors Considered When Evaluating Results from Lake Samples

All fish tissue data are aggregated for a given lake or reservoir unless there is evidence that fish caught from certain parts of the lake were isolated and may have been exposed to a different level of contamination.

Fish community structure within a lake can clearly influence the fish community structure for some distance in streams flowing from lakes. Given this, results from lakes and reservoirs are applied downstream into adjacent watersheds in cases where there are downstream data to support the assessment. In cases where there are no data available for out-flowing streams, results for lake samples are applied only to the lake from which they are collected.

RECREATIONAL USE ASSESSMENTS

For streams, IDEM applies the decision-making process shown in Table 11 where data minimums for recreational use assessments in Table 2 are met. For lakes, IDEM conducts two types of assessments to determine the extent to which Indiana lakes and reservoirs support recreational uses. Where there are available bacteria data, IDEM assesses recreational use support within the context of human health in the same manner as it does with streams (Table 11). IDEM also evaluates the degree to which Indiana's lakes and reservoirs support recreational use within the context of aesthetics. The types of data used in these assessments and the required data minimums are shown in Table 2. The assessment process is described in Table 13 and explained in more detail in this section.

Table 11: Methods used to assess Indiana waters for recreational use support within the context of human health.

Recreational Use Support (Human Health) – All Waters		
IDEM has two different methods for determining recreational use support, depending on the type of data set being used in making the assessment. For data sets consisting of five equally-spaced samples over a 30-day period, IDEM applies two tests, both of which are based on the U.S. EPA's Ambient Water Quality Criteria for Bacteria - 1986 (U.S. EPA, 1986), which provides the foundation for Indiana's WQS for recreational use. For data sets with 10 or more grab samples but without the five samples equally-spaced over the 30 days required to calculate a geometric mean, the 10% rule is applied. When both types of data sets are available, the assessment decision is based on the data set consisting of five samples, equally-spaced over a 30-day period during the recreational season as defined in Indiana's WQS (April 1 to October 31).		
Bacteria (E. *coli*): at least five equally-spaced samples over 30 days. (cfu = colony forming units)	**Fully Supporting**	**Not Supporting**
	Geometric mean does not exceed 125 cfu/100mL	Geometric mean exceeds 125 cfu/100mL.
Bacteria (E. *coli*): grab samples (cfu = colony forming units)	Not more than 10% of measurements are greater than 576 cfu/100mL (for waters infrequently used for full body contact) or 235 cfu/100mL (for bathing beaches)[6]. And Not more than one sample is greater than 2,400 cfu/100mL.	More than 10% of samples are greater than 576 cfu/100mL or more than one sample is greater than 2,400 cfu/100mL.

On a national scale, the number one impairment of lakes and reservoirs has long been identified as nutrients. Prior to 2008, IDEM's lakes assessments were largely limited to CWA Section 314 assessments of lake trends and trophic state, due in part to the absence of numeric water quality criteria for nutrients in the state's WQS. Indiana's WQS do contain narrative criteria applicable to all waters of the state. However, developing an assessment methodology that translates narrative criteria in a scientifically defensible way remains a challenge for states.

In 2008, IDEM developed an assessment method for determining the degree to which nutrient enrichment may be impacting the aesthetic value of Indiana lakes and their use for recreational activities, which is based on benchmark values for total phosphorus (TP) and chlorophyll *a* (CHL) developed by Limno-Tech, Inc. (LTI) (Table 13).

Table 12: Recommended phosphorus thresholds and their corresponding expected ranges of chlorophyll-a concentrations.

Lake Type	TP (µg/L)	Associated Range in CHL (µg/L)
Natural Lakes	54	4 to 20
Reservoirs	51	2 to 25

Source: Modified from LTI (2007).

[6] The value of 576 cfu/100mL comes from U.S. EPA's Ambient Water Quality Criteria for Bacteria - 1986 (U.S. EPA, 1986) and represents the single sample maximum applicable to waters infrequently used for full body recreation. For data collected from bathing beaches, the single day maximum value of 235 cfu/100mL is applied.

The associated range of CHL represents the range of concentrations expected when TP concentrations are at or below 54 µg/L for natural lakes or 51 µg/L for reservoirs, respectively. In some cases, the CHL results are not consistent with the expectations shown in Table 13 based on the TP levels measured for a given lake (for example, low CHL values associated with high TP values or vice versa). For these situations, IDEM's methodology uses the trophic state index (TSI) score as a surrogate response variable (in addition to CHL) to determine impairment status.

While the TSI does not provide a direct response variable for TP, it can be a useful indicator in cases where CHL results are mixed. In addition to providing a surrogate measure for CHL, the TSI score also provides a good measure of the overall trophic condition of a given lake. Recognizing the connection between trophic status and nutrient enrichment, the U.S. EPA generally considers hypereutrophic conditions as measured by the TSI indicative of impairment (U.S. EPA, 2000c).

IDEM does not believe that the TSI score alone is sufficient information for making designated use assessments because it can be affected by a number of variables in addition to nutrient loading, such as levels of non-algal turbidity or factors that may be limiting algal growth. However, in cases where the CHL and TP results are mixed, IDEM uses the most recent TSI score to determine impairment. If the TSI score indicates eutrophic or hypereutrophic conditions, the lake is assessed as impaired. TSI scores are not used in the absence of CHL results and are only reviewed in cases where there are sufficient TP and CHL data but those data showed conflicting results.

These threshold values are applied as benchmarks for the purposes of determining recreational use support of Indiana's natural lakes and reservoirs within the context of aesthetics in the following manner:

Step 1. Determine the available data to be used for assessment

Indiana's Clean Lake Program (CLP) samples between 70 and 80 lakes each year selected from a randomized list of all public lakes and reservoirs in the state that have a usable boat ramp and are larger than five acres. Lakes are monitored from July through August, which is the time of year when worst-case scenarios and stable conditions (warm temperatures, thermal stratification, hypolimnetic anoxia, and algal blooms) are expected.

All available data for a given lake were used for assessment purposes. U.S. EPA guidance suggests that, while all readily available data should be reviewed, 305(b) assessment decisions should be based on data that is five or fewer years old. The use of historical data is necessary because the sampling conducted by IDEM's CLP program is designed specifically to support CWA Section 314 assessments of trophic state and lake trends but not to make designated use assessments. As a result, while Indiana's CLP sampling strategy ensures sufficient samples for determining trophic state and trends, it does not guarantee sufficient data for making designated use assessments (see Table 2 for minimum data requirements). To date, most CWA 305(b) assessments rely on the following CLP data sets:

- One-time samples collected from public access lakes by students at Indiana University's School of Public and Environmental Affairs and analyzed in the CLP's laboratory.
- Monthly TP and CHL samples collected from public and private lakes by trained volunteers and sent to the CLP's laboratory for analysis.

Step 2. Determine adequate data for assessment

For purposes of determining recreational use support within the context of aesthetics, the following general rules were applied:

- Only TP and CHL data, including volunteer-collected data, analyzed in the CLP's laboratory in accordance with the CLP Quality Assurance Project Plan were used for assessment purposes.
- A minimum of three years' worth of data was considered sufficient for assessment purposes as long as each TP value had a corresponding CHL value.
- Multiple results within a given year for TP and CHL were averaged to provide a single value for each parameter for that year.
- For consistency in assessments, all samples used in attainment decisions must have been collected during the summer season.

Step 3: Apply benchmark criteria to determine use support

The TP and CHL thresholds shown in Table 12 were applied to all natural lakes and reservoirs for which sufficient data were available. IDEM's methods for applying these criteria are summarized in Table 13 and are illustrated in Figure 2. All waters found to be not supporting of recreational use (aesthetics) were categorized as impaired and placed in Category 5A of Indiana's 303(d) List of Impaired Waters.

Given the robust, Indiana-specific dataset upon which the thresholds recommended in the Limno-Tech, Inc. (LTI) study were developed, IDEM believes them to be appropriate for making designated use assessments.

Table 13: Methods used to assess Indiana lakes and reservoirs for recreational use support within the context of aesthetics.

Recreational Use Support (Aesthetics) – Lakes and Reservoirs		
	Fully Supporting	**Not Supporting**
Natural Lakes	Not more than 10% of all TP values greater than 54 µg/L and their associated (CHL) values are less than or equal to 20 µg/L	Less than 10% of all TP values are greater than 54 µg/L but their associated CHL values are greater than 20 µg/L, and the CHL trophic state index (TSI) score for the lake indicates eutrophic (50-70) or hypereutrophic (greater than 70) conditions Or More than 10% of TP values are greater than 54 µg/L with associated CHL values less than 4 µg/L, but the TSI (CHL) score for the lake indicates eutrophic (50-70) or hypereutrophic (greater than 70) conditions Or More than 10% of all TP values are greater than 54 µg/L with associated CHL values greater than 4 µg/L
	Fully Supporting	**Not Supporting**
Reservoirs	Not more than 10% of all TP values greater than 51 µg/L and their associated CHL values are less than 25 µg/L	Less than 10% of all TP values are greater than 51 µg/L but their associated CHL values are greater than 25 µg/L and the TSI (CHL) score for the lake indicates eutrophic (50-70) or hypereutrophic (greater than 70) conditions Or More than 10% of all TP values are greater than 51 µg/L with associated CHL values less than 2 µg/L, but the TSI (CHL) score for the lake indicates eutrophic (50-70) or hypereutrophic (greater than 70) conditions Or More than 10% of all TP values are greater than 51 µg/L with associated CHL values greater than 2 µg/L

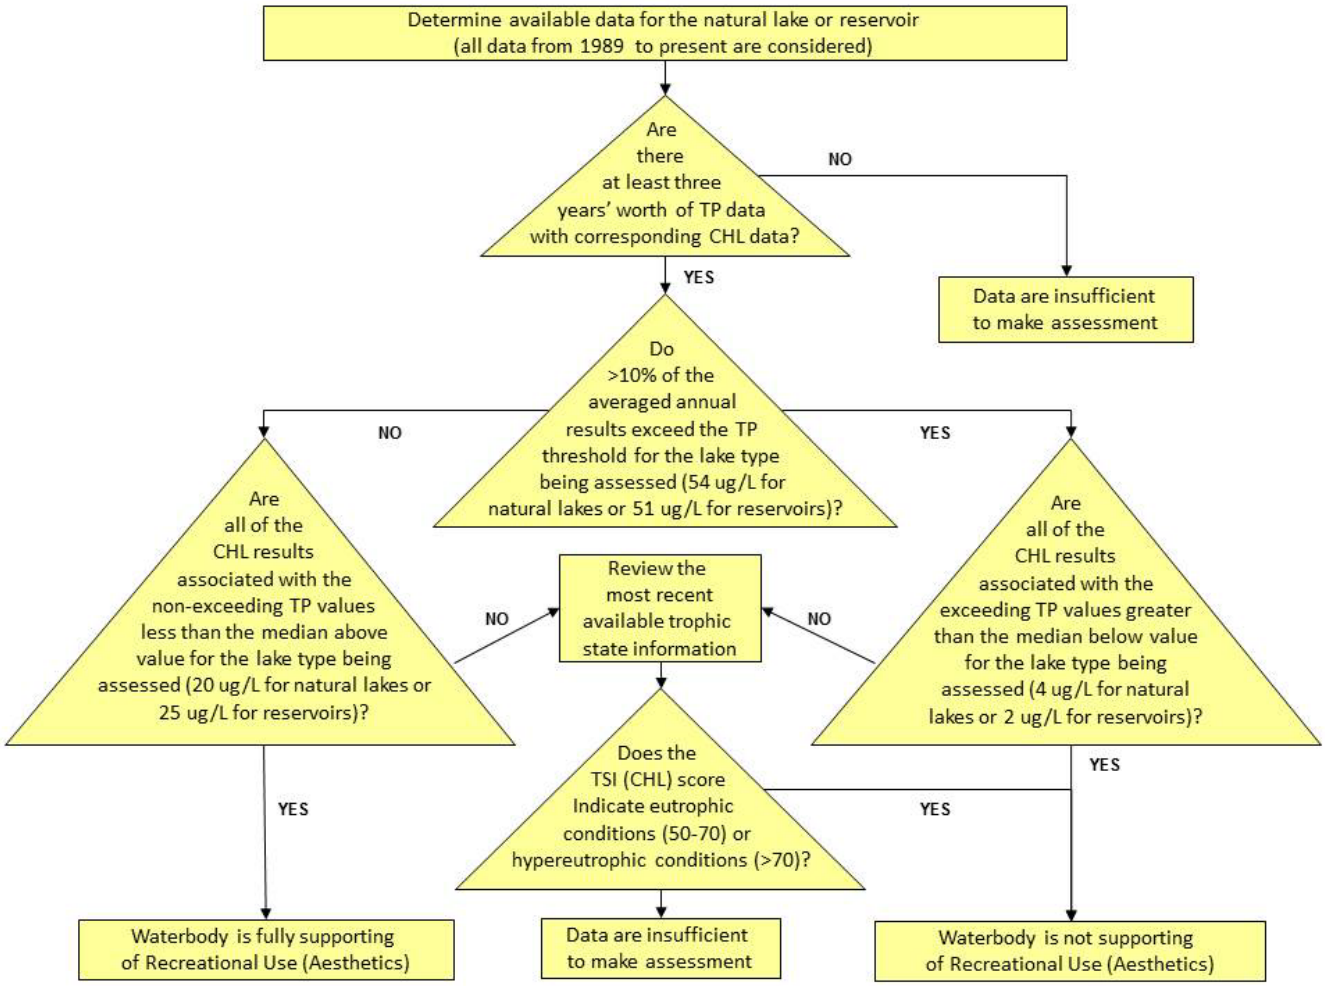

Figure 2: IDEM's assessment process for determining recreational use support for lakes within the context of aesthetics (TP = Total Phosphorus; CHL = Chlorophyll a; TSI = Trophic State Index).

PUBLIC WATER SUPPLY USE ASSESSMENTS

From 2002 to 2016, IDEM's methods for determining support of the public water supply (PWS) use changed very little. In 2015, IDEM convened an internal work group to develop a more comprehensive methodology for assessing waters designated as source waters for public water supplies. The result of this effort was a significant revision to IDEM's previous methods, which were first published for public review and comment on April 6, 2016 (IDEM, 2016) and became effective with the 2018 Integrated Reporting cycle.

IDEM's revised methods for PWS use assessments build on the water quality criteria in Indiana's WQS and other benchmarks intended to protect the quality of source water prior to its withdrawal and treatment by drinking water facilities. These methods describe:

- The type of waterbodies to be assessed and the geographical extent to which the assessment will apply.
- The indicator(s) to be used in the assessment decision and the period of record during which water quality monitoring results and other information are considered representative for assessment purposes.7
- Minimum water quality data and other information required for assessment including the minimum number of monitoring results necessary for the decision and any sampling frequency or seasonality requirements, or both.
- The applicable water quality criteria or other benchmarks, or both and the number of exceedances allowed.

Waterbodies Designated for Public Water Supply Use

Unlike most other designated uses, which apply to all waters of the state, the public water supply use is very narrowly defined in Indiana's WQS. The water quality criteria specific to PWS were established to protect the surface water quality at the intake, which is the point at which the water is withdrawn for treatment. Drinking water provided by PWS facilities is regulated by the Safe Drinking Water Act (SDWA) with the use of maximum contaminant levels (MCLs), which apply to water after it has been withdrawn and treated for human consumption. A comparison of the water quality criteria and benchmarks IDEM uses for its CWA assessments and SDWA MCLs can be found in Attachment D.

IDEM's previous and current methodology designates any waterbody with an active[8] surface water intake as a source water for the purposes of making CWA 305(b) assessments and 303(d) listing decisions. However, the revision to the methodology expands the definition of a source water to include surface waters with intakes for emergency water supplies and those waters that have been determined to have a direct influence on a public water supply well. Although intakes for emergency water supplies are not regularly used for source water, they may be placed into service if needed and, thus, should carry the same designation as other source waters.

---

[7] IDEM considers any existing and readily available data received for the purposes of determining use support. Most assessments are based on data collected during the period of record, which is the period of time in which the data are considered reliable for the purposes of assessment. The period of record varies based on the type of assessment and data being evaluated but always includes the most recent data available. Older data collected prior to the period of record is considered supplementary and can often provide additional insights into current water quality conditions.

[8] "Active" intakes are those that are currently in use. "Inactive" intakes are those that were previously in service but taken offline by the treatment facility and which are unlikely to ever be re-activated.

IDEM has also identified five public ground water supply systems that are under the direct influence of surface waters. While the surface waters influencing these systems are not themselves used as source waters, IDEM has designated them as such based on their potential to transport contaminants into the groundwater supplying these systems. If and when IDEM identifies additional surface waters with the potential to directly influence a public water supply well, they will be designated for the public water supply use and assessed in the manner described in this methodology.

Inland Lakes and Streams

For inland lakes and streams, IDEM's methods for defining assessment units for PWS are based on the approach described in Indiana's Source Water Assessment Plan (SWAP) (IDEM, 2000) for developing source water assessments (SWAs) required under the federal SWDA for public water supplies that rely on surface water as part or all of their supply. This approach includes an evaluation of susceptibility, which is the potential for a PWS intake to draw in surface water with contaminant concentrations that would cause concern for water utility operators or the consumer (IDEM, 2000).

According to the SWAP, susceptibility may be represented as a series of "zones" for the purposes of developing contingency plans and to prepare for emergency response. The zones in which contamination has the potential to create a water supply emergency or have otherwise adverse effects within a matter of hours or days are those in close proximity to the intake.

While these zones are not intended to support water quality assessments for the purposes of CWA 305(b) assessments, their use for assessments is in keeping with the water quality criteria in Indiana's WQS, which were "established to protect the surface water quality at the point at which water is withdrawn for treatment for public supply."

Inland lakes and reservoirs are treated as individual assessment units for the purposes of PWS assessments, regardless of where in the waterbody an intake is located. This is consistent with Indiana's SWAP in which susceptibility zones are defined around the entire perimeter of the lake. This approach assumes that contaminants introduced anywhere in the lake have the potential to impact the quality of the water withdrawn at the intake and, therefore, provides a representative unit of assessment for the purposes of determining designated use support.

For all streams, including the Ohio River, IDEM has defined assessment units for each intake based on the "Emergency Management Zone", which begins at the point of surface water withdrawal at the intake to 1,000 feet upstream. The assessment units in the Indiana Reach Index, on which surface water intakes are located, are currently much larger than 1,000 feet and will need to be re-indexed to accommodate these more narrowly applied assessments.

Lake Michigan

IDEM's PWS use assessments for Lake Michigan will apply only to the areas in which source waters are withdrawn within Indiana's state boundary. For the purposes of determining support of PWS use in Lake Michigan, IDEM has defined its assessment units based on the "Immediate Nearshore Area" (INA) as defined in Indiana's SWAP. The INA is all the land within 1,000 feet of the shoreline extending 0.5 mile on either side of where the intake pipe intersects the shoreline area. This is the area that has the greatest potential for contaminants coming from the shoreline to have adverse effects on the PWS within a matter of hours or days. Therefore, the lateral distance of each assessment unit will be

limited to the INA and extend from the outer boundary of the nearshore area[9] to the Indiana border, which lies in the offshore waters of Lake Michigan (Figure 3).

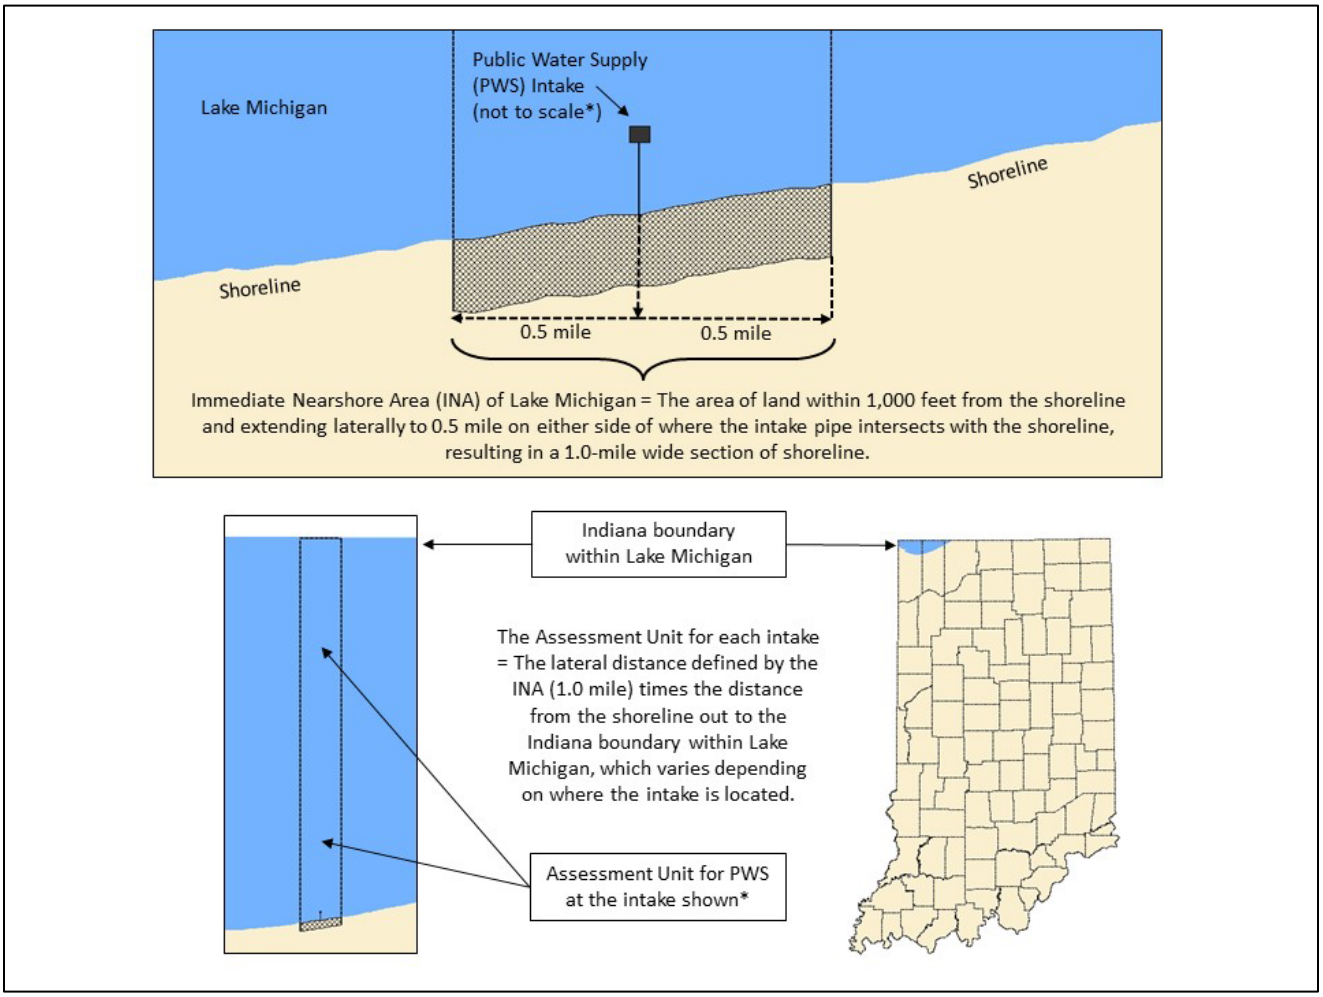

Figure 3: Definition of Lake Michigan assessment units for the purposes of determining PWS use support.

*The source water intake shown is for illustration purposes only and does not represent any specific intake on Lake Michigan.

Surface Waters with a Direct Influence on a Public Water Supply Well

To date, IDEM has identified five public water supply systems with one or more wells that are under the direct influence of surface water. All of these wells belong to community public water supply systems, which are public water systems that provide water for human consumption to at least 15 service connections used by year-round residents or that regularly serve at least 25 year-round residents (for example, municipalities, subdivisions, and mobile home parks). IDEM expects to identify additional public water supply wells and possibly some non-transient, non-community system wells that are under the direct influence of surface water in the future. Non-transient, non-community systems are public

[9]In its Great Lakes Monitoring and Research Strategy, U.S. EPA defines the boundary between offshore and nearshore areas as the depth contour equal to the mean depth of the lake. The nearshore area consists of water adjacent to the shoreline and not more than 85 meters in depth, and the offshore is the remaining portion of the lake. (U.S. EPA, 1992)

water supply systems that serve at least 25 of the same people more than six months per year (for example, schools, factories, industrial parks, office buildings, etc.).

For any public water supply system well under the direct influence of surface waters, it is possible that pollutants in surface waters located within the well field can reach the well through infiltration, absorption into the soil, or conduits, such as field tiles or water distribution piping that intercepts sandy soils. Specific sources of contaminants vary based on location but can include agricultural chemicals and nonpoint source runoff from roads and highways.

The geographic extent of surface water influence has been modeled in the Wellhead Protection Plans for those community public water supply systems with areas known to be susceptible to surface water. For the purposes of PWS use support assessments, any surface water within the modeled area of influence will be designated as a PWS.

Non-transient, non-community public water systems are not required to complete a Wellhead Protection Plan. When a non-transient, non-community public water system well is found to be under the direct influence of surface water, IDEM will require the system to complete a Source Water Assessment, which will define a 3,000-foot radius of concern around the well. For the purposes of PWS use support assessments, any surface water within the 3,000-foot radius of concern will be designated as a PWS.

Water Quality Indicators for Determining Support of Public Water Supply Use

Indicators used in the assessment of use support for PWS include:

- Any substances for which numeric criteria for human health apply at the point of water intake that have been identified in Indiana's Water Quality Standards[10] located in Table 6-1 of 327 IAC 2-1-6 and Table 8-3 of 327 IAC 2-1.5-8.
- Any substances for which numeric criteria are defined specifically for the public water supply use[11] with the exception of total coliform bacteria for which Level 1 and Level 2 Assessments under the federal SDWA Revised Total Coliform Rule (RTCR) are used.
- The cyanobacterial toxins Cylindrospermopsin and Microcystin-LR for which U.S. EPA has issued drinking water health advisory values.

Water Quality Criteria and Other Benchmarks for Assessing Support of PWS Use

Human Health Criteria Applicable at the Point of Intake and Other Water Quality Criteria Specific to the PWS Use

Indiana's WQS contain human health criteria for several substances applicable at the point of intake in order to protect the public from negative health effects that could occur if they are found in high concentrations in source waters. For waters in the Great Lakes basin, IDEM will apply the most stringent of the Human Noncancer Criterion (HNC) or the Human Cancer Criterion (HCC) defined for drinking water in Table 8-3 of Indiana's WQS.

[10] The criteria identified in Table 6-1 are applicable to waters outside the Great Lakes basin and can be found in 327 IAC 2-1-6. The criteria identified in Table 8-3 apply to waters located within the Great Lakes basin and can be found in 327 IAC 2-1.5-8.

[11] For all waters in the Great lakes basin, these substances and criteria are defined in 327 IAC 2-1.5-8(f). For all other Indiana waters, these substances and criteria are defined in 327 IAC 2-1-6(e).

For waters outside the Great Lakes basin, IDEM will apply the continuous criterion concentration (CCC) values shown in Table 6-1 of Indiana's WQS at the point of water intake, which represents the most stringent human health criterion for a given substance and is, thus, the most protective of the PWS use.

Indiana's WQS contain numeric criteria specifically for waters designated as source waters for PWS, which like human health criteria, are applicable at the point of intake[12]. The WQS also include the following criteria to prevent taste and odor issues and to protect human health:

- Chloride (250 mg/l)
- Sulfate (250 mg/l)
- Dissolved solids (750 mg/l) (or 1,200 micromhos specific conductance as a surrogate)
- Nitrite (1 mg/l)
- Nitrogen, measured as the sum of nitrate and nitrite (10 mg/l)

The criteria for chloride, sulfate, and dissolved solids are intended to prevent taste and odor issues. The criteria for nitrite and nitrogen are intended to protect human health.

IDEM will apply these criteria to data sets meeting the minimum data requirements identified in Table 2 and that were collected from waters designated for PWS in accordance with this methodology.

Indiana's WQS also contain numeric criteria for total coliform bacteria for waters designated as source waters for PWS and that are also applicable at the point of intake[13]. However, because exceedances of these criteria in source waters do not prohibit or otherwise limit the use of those waters for PWS, IDEM, instead, bases its assessment methodology for bacteria in source waters on the federal SDWA RTCR (U.S. EPA, 2013b). The RTCR went into effect in Indiana on April 1, 2016, replacing the Total Coliform Rule which had been in effect since 1989. Under the previous rule, there was no systematic way to determine when MCL violations for bacteria were attributable to source water issues. The RTCR now provides a means of identifying public water supplies adversely impacted by bacterial contamination in source waters and, as such, provides greater opportunity for their protection through IDEM's CWA programs.

The RTCR is intended primarily to ensure the integrity of the drinking water distribution system. However, the Level 1 and Level 2 Assessments, which are required in cases where bacteria are detected in treated water, requires an examination of source waters in addition to the investigation of other factors[14]. Therefore, the results of Level 1 and 2 assessments conducted under the RTCR will reveal those situations in which MCL violations for bacteria are attributable to source water contamination as opposed to issues within the treatment plant or its distribution system, or both.

Although all PWS are required to sample for bacteria, bacterial contamination in source water is primarily a concern for facilities that draw their supplies from surface water, which is vulnerable to far more sources of fecal contamination than ground water. PWS wells under the direct influence of surface water are also somewhat vulnerable to bacterial contamination. However, bacteria can be effectively removed with conventional PWS treatment, specifically, the disinfection portion of the treatment

[12] For waters in the Great lakes basin, these substances and criteria are defined in 327 IAC 2-1.5-8(f). For all other Indiana waters, these substances and criteria are defined in 327 IAC 2-1-6(e).
[13] See footnote 14.
[14] See http://in.gov/idem/cleanwater/2494.htm for more detailed information regarding Level 1 and Level 2 Assessments under the RTCR.

process, which is required for all surface water systems. It is rarely the case that MCL violations for bacteria in treated water are the result of excessive bacterial concentrations in source water[15].

By using RTCR assessment results instead of applying a numeric criterion, IDEM's PWS methodology balances the possibility that bacterial contamination in a source water might impair its designated use (by prohibiting or otherwise limiting its use for PWS) with the greater likelihood that MCL violations for bacteria (indicators of potential impairment) are attributable solely to issues within the treatment plant or its distribution system, or both. Using the RTCR ensures that IDEM's assessments:

- Identify those rare cases in which bacterial contamination in source water is limiting or prohibiting the use of an otherwise treatable supply or driving a need for additional treatment beyond conventional treatment methods.
- Do not assess source waters as impaired based on MCL violations attributable to problems within the facility or its distribution system, or both. This may include issues for which other regulatory means already exist to provide a remedy under the SDWA.

A facility that has completed an assessment pursuant to the RTCR and has found a problem to be attributable to bacterial contamination in the source water will assess that source water as impaired. If such an assessment finds the problem to be the result of issues within the facility or distribution system, IDEM will assess the source waters as fully supporting of PWS use. In the absence of any RTCR assessments, the waterbody will remain not assessed for PWS.

Benchmarks Used to Assess for Cyanobacterial Toxins

Algae are a common component of aquatic ecosystems in lakes and streams. However, the concentrated presence of blue-green algae (cyanobacteria) can be linked to some adverse health effects, and, as a result, cyanobacterial toxins are a growing concern for drinking water facilities. However, not all blue-green algal blooms produce toxins, and the specific conditions that lead to cyanobacterial toxin production are not well understood in the scientific community.

The SDWA requires water treatment facilities to notify the public when they detect a health risk in treated drinking water supplies. IDEM considers any consumption and use notification issued by a water treatment facility based on cyanobacterial toxin concentrations in treated drinking water to be indicative of source water impairment.

Currently, there are no U.S. federal numeric water quality criteria or regulations for cyanobacteria or cyanobacterial toxins in drinking water under the SDWA or for ambient waters under the CWA. Indiana's WQS, likewise, contain no numeric criteria for these substances. However, they do contain narrative criteria intended to protect surface water quality, including those waters designated as a PWS. These criteria state that all Indiana surface waters shall be "free from substances in concentrations that on the basis of available scientific data are believed to be sufficient to injure, be chronically toxic to, or be carcinogenic, mutagenic or teratogenic to humans…"[16]

[15] Personal communication with Stacy Jones, Technical Environmental Specialist for IDEM OWQ's Drinking Water Branch (January 15, 2016).
[16] 327 IAC 2-1-6 (a)(2) and 327 IAC 2-1.5-8(b)(2).

In the absence of state or federal numeric criteria for cyanobacteria or cyanobacterial toxins, IDEM considers the following benchmarks provided in U.S. EPA's drinking water 10-day health advisories defensible for use in assessments based on Indiana's narrative water quality criteria (U.S. EPA, 2015b and 2015c):

- Cylindrospermopsin concentrations greater than 0.7 micrograms per liter (µg/L).
- Total Microcystin concentrations greater than 0.3 µg/L (using Microcystin-LR, one of the most potent forms of the toxin, as a surrogate).

Cyanobacterial blooms are seasonal in nature with most occurring in later summer. However, high concentrations of cyanobacterial toxins have been found to occur even in colder months. Therefore, IDEM applies these benchmarks to data collected at any time of the year. The occurrence of cyanobacterial toxins in treated drinking water depends on their levels in the raw source water and the effectiveness of treatment methods for removing cyanobacteria and cyanobacterial toxins during the treatment process.

U.S. EPA developed its Health Advisory values to protect the public from exposure to cyanobacterial toxins in treated drinking water rather than in source waters. For this reason, using these values as benchmarks for the assessment of untreated source waters is conservative in nature, and, based on the idea that if source waters meet these benchmarks, drinking water treatment plants can be reasonably confident that their treatment processes will result in concentrations that are below those that might result in adverse health effects.

However, IDEM's CWA 305(b) and 303(d) assessment and listing processes should not be construed as a public health advisory because they do not reflect conditions in real time. U.S. EPA's health advisories for cyanobacterial toxins are intended to guide treatment decisions when the risk of cyanobacterial toxin contamination is high.

It is important to emphasize that the public cannot assume that, because a particular waterbody appears on the 303(d) list for a cyanobacterial toxin impairment, the treated water they draw from the tap is in any way unsafe to drink. The 303(d) list identifies waterbodies that are not fully supporting their designated uses, but the list is not intended to provide the public with information regarding the quality of the treated drinking water they get from a PWS.

While mindful of the differences in purpose and function of U.S. EPA's health advisories and CWA requirements to determine the degree to which our surface water resources are supporting their use as a PWS, IDEM believes that applying U.S. EPA's Health Advisory numbers as benchmarks provides for greater protection of source waters. Many of the same practices that can help to control taste and odor issues, which are often driven by nutrient enrichment, can also help to reduce the occurrence of algal blooms in surface waters. Where sufficient data are available, applying these benchmarks will help to identify those source waters that are more susceptible to cyanobacterial toxins and prioritize them for further evaluation for CWA Sections 303(d) and 305(b) purposes.

Minimum Data Requirements for Assessment

All available water quality data meeting IDEM's data quality requirements, whether collected by IDEM or external parties, will be used for assessment. U.S. EPA guidance suggests that, while all readily available data should be reviewed, 305(b) assessment decisions should be based on data that is five or fewer years old. For bacteria, all Level 1 and Level 2 Assessments performed in accordance with the RTCR within the most recent five consecutive years will be considered valid for the purposes of designated use assessments of PWS.

Table 2 provides minimum data requirements for assessments of PWS use support along with any corresponding requirements regarding timing and frequency of data collection activities.

For each AU with sufficient data to make one or more designated use assessments, IDEM applies the 305(b) assessment process described in Table 2. The specific criteria or benchmarks to be applied to the data will depend, in some cases, on the location of the waterbody from which they were collected. Assessment data are integrated for the purposes of making water quality assessments, which means that all data for a given waterbody are considered together and each type of data are treated as independently applicable.

Obtaining the Data Needed for Assessment

The PWS use is unlike other designated uses in that it is very narrowly defined in Indiana's WQS. Given the limited size of the AUs defined and designated for PWS, IDEM has very little existing data in its own database or from other sources to use for assessments with this methodology. IDEM is working to remedy that with the development of a monitoring strategy that is expected to provide usable data for assessments.

In 2016, in collaboration with 22 of Indiana's 33 PWS facilities that have surface water intakes, IDEM began working on a pilot project to monitor for several parameters that are expected to provide data for potential use in IDEM's PWS assessments. The project began as an effort to better understand the potential impacts that algae and cyanobacteria in source water have on the ability of PWS facilities to adequately treat the water for human consumption and to inform future treatment options if concentrations ever reach levels requiring additional methods beyond the conventional measures currently in place.

For this project, samples are collected by each facility from within the facility at its raw water intake, and treated water samples are collected on the same day. IDEM provides the sample bottles and shipping labels to the facilities and pays for them to ship the samples on ice to a laboratory selected by IDEM. IDEM also pays for the analytical costs. Samples are analyzed for a number of parameters that may yield data suitable for IDEM's PWS assessments, including:

- Chloride and sulfate
- Specific conductance
- Nitrogen, as nitrate + nitrite
- Trihalomethane
- Cylindrospermopsin and Microcystin

IDEM continues to work on building collaborative partnerships with drinking water facilities and other interested parties to collect the high quality data needed to support assessments in the future. IDEM will also explore the feasibility of expanding its own monitoring program to provide water quality data for assessment and continues to seek additional sources of existing data at or near surface water intakes.

CWA SECTION 314 ASSESSMENTS OF INDIANA'S LAKES AND RESERVOIRS

In addition to IDEM's CWA Section 305(b) assessments for fish consumption, recreational use, and PWS, IDEM also conducts trend and trophic state assessments of Indiana lakes and reservoirs. These assessments are made to satisfy the requirements of CWA Section 314, which requires states to report on the trophic status and trends of all publicly owned lakes in Indiana. Most of the data used in these assessments comes from the Indiana Clean Lakes Program (CLP).

The CLP samples approximately 80 lakes each year in July and August, which is the time of year when worst-case scenarios and stable conditions (warm temperatures, thermal stratification, hypolimnetic anoxia, and algal blooms) are expected.

Prior to 2010, lakes were selected for sampling based on logistical considerations to minimize travel costs. With 401 public lakes in the state, this strategy ensured that most lakes would be monitored once every five years. While these results can be applied to individual lakes, they were regionally restricted and could not be used to make statistical inferences about the trophic conditions of lakes on a statewide basis.

In 2010 and in consultation with IDEM, the CLP began using a randomized approach to select lakes for sampling in order to support a statewide assessment of trophic condition of Indiana lakes. Now, at the beginning of each sampling season, the CLP randomizes its list of public lakes and selects the first 80 on the resulting list to be monitored that season. Each season, the list is re-randomized. Using this approach, it is no longer a given that all 401 of Indiana's public lakes will be monitored in five years. However, the data collected now provides statistically significant results that can be applied to the entire state. These results are published every two years in the CLP's *Indiana Lake Water Quality Assessment Report*, which is available online at: http://www.indiana.edu/~clp/PUBreports.php.

The CLP also made changes to its sampling and analytical methods for phytoplankton, which in turn required changes in the methods IDEM uses to determine the trophic status of individual lakes and reservoirs. These changes, which are discussed in more detail in the following section, impact both IDEM's CWA Section 314 assessments and, to a lesser degree, its CWA Section 305(b) assessments.

Prior to 2010, IDEM used the Indiana State Trophic Index (ISTI) to determine the trophic status and trends in individual lakes throughout Indiana using data collected for the most part by the CLP. In 2010, the CLP made the following changes in its sampling and analytical methods for phytoplankton samples:

- Sample Collection – The CLP switched from using a 63-micron vertical tow net, which captures plankton in the water column greater than 63-microns in size, to an integrated sampler, which captures all the plankton in the water column, resulting in a more representative sample.
- Sample Analysis – The CLP changed its methods for counting plankton from natural units per liter (NU/L) to the number of cells per milliliter (cells/ml). NU/L represents a single organism, which may be a single-celled or multi-celled colonial form. Cell density measured as cells/ml is now preferred among phycologists and limnologists today because it represents the total number of phytoplankton cells including those aggregated in multi-celled colonies.

These changes eliminated some of the indicators required to calculate the ISTI. After the first season in which they were implemented, the CLP performed an analysis to determine whether plankton results expressed in cells/ml could be converted to NU/L for the purposes of calculating the ISTI. The CLP found no clear statistical relationship between the results produced by the two methods that would allow such conversion. Given this, future ISTI scores calculated with plankton data collected and analyzed with the new protocols would generate substantially different results not comparable with previous data. Comparability over time is necessary because IDEM also uses trophic scores to determine lake trends for the purposes of CWA Section 314. In order to ensure comparability, IDEM decided to abandon the use of the ISTI in favor of Carlson's TSI (Carlson, 1977) to determine the trophic condition of Indiana lakes and reservoirs.

IDEM now uses Carlson's TSI exclusively in its CWA Section 314 assessment to determine trophic status and trends for individual lakes. IDEM's CWA Section 305(b) assessment methods for lakes, which are discussed in a later section of this methodology, also rely in part on the Carlson's TSI scores. IDEM's addendum to its 2016 Integrated Report provides the most recent Carlson TSI scores for all lakes for which sufficient data exist to calculate them.

Trophic State Assessments

As noted in the previous section, IDEM now uses the Carlson Index to calculate TSI scores for Indiana lakes. The Carlson TSI score is a measure of algal biomass that can be calculated for three variables, all of which can be used as independent indicators of the amount of algal biomass present in the waterbody. This is the trophic state of the lake or reservoir in question.

The three indicators used are Secchi depth (SD), total phosphorus (TP), and Chlorophyll-*a* (CHL). The TSI is a scale of 0-100 based on the interrelationships of these three variables using data from northern temperate lakes in North America. The equations used to calculate the Carlson TSI are:

$$TSI\ (SD) = 60 - 14.41\ \ln(SD) \qquad \textit{Equation 1}$$

$$TSI\ (CHL) = 9.81\ \ln(CHL) + 30.6 \qquad \textit{Equation 2}$$

$$TSI\ (TP) = 14.42\ \ln(TP) + 4.15 \qquad \textit{Equation 3}$$

Theoretically, each TSI score should independently tell the same "story" about the trophic state of a given lake. However, often they do not. This is because not all the assumptions used in the development of the Carlson Index hold true for Indiana lakes.

The index assumes that suspended particulate matter in the water controls transparency (Secchi depth) and that algal biomass is a major source of particulates. However, many Indiana lakes are affected by non-algal turbidity, which can heavily influence transparency. The index also assumes that total phosphorus is the major limiting factor in algal growth and that all forms of phosphorus are present and playing a role in the production of algal biomass. Like those associated with Secchi depth, these assumptions may not hold true for lakes impacted by domestic sewage, which can contribute higher amounts of orthophosphate, or in lakes naturally enriched with organic material where humic acids can bind with the phosphorus reducing its concentration in the water column.

Unlike total phosphorus, which may or may not be the primary limiting factor in algal production, CHL concentration provides a more direct measure of phytoplankton abundance. Also, CHL concentration is not affected by non-algal turbidity like Secchi depth can be. Therefore, IDEM uses the

TSI for CHL for trophic state classification for the purposes of its CWA 314 assessments using the classification systems shown in Table 14. However, because divergent results for a given lake allow for comparisons that can yield additional insights into how different components of a lake's ecosystem might be functioning, all three trophic scores are reported for each lake where possible.

Table 14: Trophic states and predicted characteristics based on Carlson TSI scores for chlorophyll-a (CHL).

Trophic State	TSI (CHL)	Corresponding CHL values (µg/L)	Characteristics of Trophic State
Oligotrophic	Less than 40	Less than 0.95 – 2.6	• Low biological productivity • High transparency (clear water) • Low levels of nutrients • Low algal production and little/no aquatic vegetation • Well oxygenated hypolimnion year round; hypolimnion of shallower lakes may become anoxic at TSI scores greater than 30
Mesotrophic	40-50*	2.6-7.3	• Moderate biological productivity • Moderately transparency (moderately clear water) • Moderate levels of nutrients • Beds of submerged aquatic plants • Increasing possibility of anoxia in the hypolimnion during summer
Eutrophic	50-70	7.3-56	• High biological productivity • Water has a low transparency • High levels of nutrients • Large amounts of aquatic plants or algae • At TSI scores greater than 60, blue-green algae dominate and algal scums and excessive macrophytes possible • Hypolimnion commonly anoxic; fish kills possible
Hypereutrophic	Greater than 70	56-155	• Very high biological productivity • Very low transparency, usually less than 3 feet • Very high levels of nutrients • Dense algae and aquatic vegetation; algal scums and few aquatic plants at TSI scores greater than 80 • Fish kills and/or dead zones below the surface are common • Hypolimnion persistently anoxic; Fish kills and/or "dead zones" below the surface common

*Lakes with a TSI score of 50, which is on the boundary between mesotrophic and eutrophic conditions, are evaluated with their corresponding TSI scores for TP and SD along with any other available information and classified in accordance to the best professional judgment of IDEM scientists.

Trend Assessments of Indiana Lakes

IDEM's method for assessing trends for the purposes of CWA Section 314 is not statistical in nature. Rather, it was developed through the best professional judgement of IDEM scientists and based on very small data sets with results separated, in many cases, by more than a decade. IDEM uses Carlson TSI scores for CHL for this purpose. Trend assessments require two or more Carlson TSI scores for CHL from sampling conducted from 1990 to present day with at least one score having been determined from data collected in the most recent five years (Figure 4). Each lake with sufficient data may be assessed as stable, improving, degrading, or fluctuating, which is intended to provide insight as to how natural conditions and human activities may be impacting the lake.

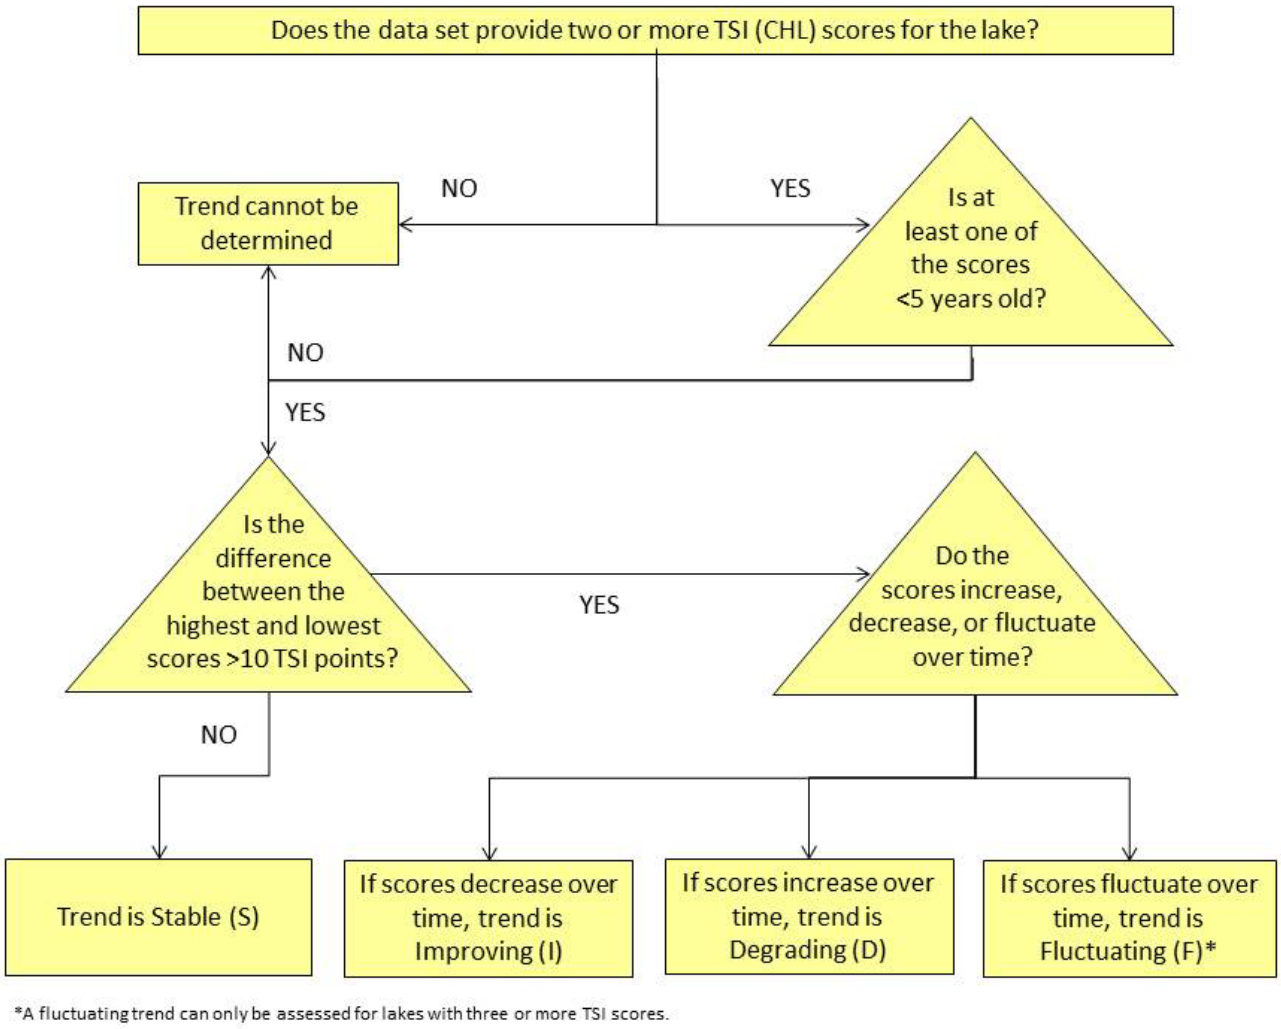

Figure 4: IDEM's method for assessing trends in the trophic condition of Indiana lakes.

CONSOLIDATED LISTING METHODOLOGY

For the development of its 303(d) List of Impaired Waters, IDEM has followed, to the degree possible, the 305(b) and 303(d) reporting methods outlined in the U.S. EPA's Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b), and 314 of the CWA (U.S. EPA, 2005) as well as the additional guidance provided in the U.S. EPA memorandums containing information concerning CWA Sections 303(d), 305(b), and 314 integrated reporting and listing decisions for the 2008, 2010, 2012, 2014, and 2016 cycles (U.S. EPA, 2006-2013a). The 303(d) list was developed using the water quality assessment data maintained by IDEM in U.S. EPA's ATTAINS. Interpretation of the data and listing decisions takes into account IDEM's assessment methodologies and the U.S. EPA's guidance.

Data from a given monitoring site are considered representative of the waterbody for that distance upstream and downstream in which there are no significant influences to the waterbody that might cause a change in water quality. Using this same rationale, data may also be extrapolated to some distance into tributaries upstream of a given sampling location. Waterbody AUs with one or more monitoring sites upstream and downstream and those for which reliable assessments can be made based on extrapolation of representative data are classified as monitored. Only monitored waterbodies are considered for 303(d) listing purposes. Any waters identified as "Not Supporting" of one or more designated uses in accordance with the criteria described in previous sections of this methodology are placed on Indiana's 303(d) List of Impaired Waters.

Interpretation of the data through the 305(b) assessment process and the subsequent 303(d) listing decisions are based in large part on U.S. EPA guidance, which calls for a comprehensive listing of all monitored or assessed waterbodies in the state. Prior to 2006, U.S. EPA required that states place each waterbody into only one category. The U.S. EPA now encourages states to place a waterbody AU into additional categories as appropriate in order to more clearly illustrate where progress has been made in TMDL development and other restoration efforts. Therefore, waterbodies are assigned to one category for each of the following designated uses: aquatic life use, recreational use, fish consumption[17], and public water supply[18]. The following describes IDEM's categorization of Indiana waters in more detail:

Category 1 The available data, or information, or both, indicate that all designated uses are supported and no use is threatened. Waters are listed in this category if there are data or other information, or both, that meet the requirements of Indiana's Consolidated Assessment and Listing Methodology (CALM) to support a determination that all designated uses are supported and no designated use is threatened.

Category 2 The available data or information, or both, indicate the individual designated use is supported. Waters are listed in this category if there are data or other information, or both, available that meet the requirements of Indiana's CALM to support a determination that the individual designated use is supported.

[17] Fish consumption is not a designated use in Indiana's WQS. IDEM assesses Indiana waters for fish consumption pursuant to current U.S. EPA policy and in keeping with CWA goals, which are reflected in Indiana's WQS (327 IAC 2-1-1.5 and 2-1.5-3.

[18] Applicable only to waters that serve as a source of water for a public water system.

Category 3 The available data or other information, or both, are insufficient data to determine if the individual designated use is supported. Waters are listed in this category if there are no data or other information, or both, to determine whether the individual designated use is supported or if the available data or information, or both, are not consistent with the requirements of Indiana's CALM.

Category 4 The available data or information, or both, indicate that the individual designated use is impaired or threatened but a total maximum daily load (TMDL) is not required based on one of the following conditions:

A. A TMDL for one or more pollutants has been completed and approved by U.S. EPA and is expected to result in attainment of all water quality criteria applicable to the designated use.

B. Other pollution control requirements are reasonably expected to result in the attainment of all water quality criteria applicable to the designated use in a reasonable period of time. Consistent with the regulation under 40 CFR Part 130.7(b)(i),(ii), and (iii), waters are listed in this subcategory where other pollution control requirements required by local, state, or federal authority are stringent enough to achieve any water quality criteria applicable to the designated use.

C. Impairment is not caused by a pollutant. Waters are listed in this subcategory if the designated use impairment is not caused by a pollutant but is, instead, attributed to other types of pollution for which a TMDL cannot be calculated.

Category 5 The available data or information, or both, indicate the individual designated use is impaired or threatened, and a TMDL is required. The following subcategories together constitute Indiana's 303(d) List of Impaired Waters.

A. This subcategory constitutes the Section 303(d) list of waters impaired or threatened by one or more pollutants for which a TMDL is required. Waters are listed in this category if it is determined in accordance with Indiana's CALM that a pollutant has caused, is suspected of causing, or is projected to cause impairment. Where more than one pollutant is associated with the impairment of a single AU, the AU will remain in Category 5 for each pollutant until the TMDL for that pollutant has been completed and approved by the U.S. EPA.

B. This subcategory constitutes the Section 303(d) list of waters that are impaired due to the presence of mercury or PCBs, or both, in the edible tissue of fish collected from the AUs at levels exceeding Indiana's human health criteria for these contaminants.

The 303(d) List of Impaired Waters consists of all impairments listed in Category 5. This category includes waters where the WQS is not attained because the waterbody AU is impaired or threatened by one or more pollutant(s) for each of which a TMDL is required. However, due to the complex nature of the contaminants involved, IDEM categorizes all fish tissue-related impairments into Category 5B (a state-defined subcategory similar to U.S EPA's 5M subcategory) deferring development of a conventional TMDL to allow other contaminant clean-up efforts to remedy such impairments.

Because each situation is unique and resources and data sets are sometimes limited, the 303(d) listing process may, at times, require IDEM staff to apply best professional judgment. To help stakeholders understand how designated use support was determined for individual waterbodies of interest, IDEM will make available upon request its water quality assessment notes for any waterbody AU, including any waterbody AU assessed in a different manner than indicated in its Consolidated Assessment and Listing Methodology.

The current 303(d) List of Impaired Waters includes impairments identified on previous 303(d) lists, which still require TMDL development. For an AU to be listed, it must have been assessed using representative data, and the data must support its listing. Any data collected internally by IDEM used for listing decisions must meet the agency's quality assurance and quality control requirements as outlined in IDEM's surface water quality monitoring Quality Assurance Project Plan (QAPP). Data collected from external sources must meet the requirements contained in the technical guidance for IDEM's External Data Framework (IDEM, 2015), which mirror those in IDEM's surface water quality monitoring QAPP for data considered usable for the purposes of CWA Sections 305(b) water quality assessments and 303(d) listing decisions.

DELISTING OF IMPAIRMENTS

U.S. EPA's guidance does not change previous rules established for listing and delisting. The existing regulations require states, at the request of the U.S. EPA's Regional Administrator, to demonstrate good cause for not including impairments on the 303(d) list that were included on previous 303(d) lists (pursuant to 40 CFR Part 130.7(b)(6)(iv)). In general, IDEM will only consider delisting an AU if at least one of the following is true:

- New data indicate that WQS are now being met for the AU under consideration. This would typically occur during IDEM's scheduled assessments when reviewing data collected through IDEM's monitoring programs.
- The assessment or listing methodology, or both, has changed, and the AU under consideration would not be considered impaired under the new methodology.
- An error is discovered in the sampling, testing, or reporting of data that led to an inappropriate listing. IDEM will review previous assessments and 303(d) listings when there is reason to believe that the original assessment was not valid. Reassessment (review of previous assessment or 303(d) listing decisions) typically occurs as a result of ongoing quality assurance and quality control (QA/QC) of IDEM's ADB or through inquiry by IDEM staff or external parties. Under these circumstances, the 305(b)/303(d) coordinator works with the IDEM staff initiating the question or receiving it from the external party to gather the necessary information and consult with other staff, as needed, to resolve the question. During reassessment, several types of information are considered, including data quality issues, past assessment methodologies, land use data, historical information from the public, or other relevant information. Regardless of the situation, no assessment is dismissed as invalid based solely on the age of the data.

- It is determined that another program, other than the TMDL program, is better-suited to address the water quality problem, or the problem is determined not to be caused by a pollutant (see Categories 4B[19] and 4C above).
- A TMDL has been completed, and the waterbody AU is expected to meet WQS after implementation of the TMDL (see Category 4A above).

TMDL DEVELOPMENT AND PRIORITIZATION FOR OHIO RIVER IMPAIRMENTS

Because the Ohio River is a boundary between states and U.S. EPA Regions, the development of a TMDL for the river will involve more than one state. To date, no TMDLs have been approved for the reaches of the Ohio River that border Indiana. However, ORSANCO is working with Ohio, West Virginia, Kentucky, Illinois, and Indiana (IDEM) to assist U.S. EPA Regions 3, 4, and 5 in completing a bacteria TMDL for the entire river.

TMDL DEVELOPMENT AND PRIORITIZATION FOR ALL OTHER INDIANA WATERS

The CWA does not clearly define the timeline for TMDL development. However, states are required by 40 CFR Part 130.7 to include with their 303(d) lists a priority ranking of impaired waters that will be targeted for TMDL development in the next two years. For each 303(d) listing cycle, IDEM works with U.S. EPA Region 5 to determine IDEM's short-term TMDL schedule.

In addition to developing a short term list of TMDL priorities every two years, IDEM has also developed a long term schedule to guide TMDL development through 2022. This schedule is included in the Agency's TMDL Program Priority Framework, which describes IDEM's process for implementing U.S. EPA's long term vision for assessment, restoration, and protection under the CWA Section 303(d) program.

U.S. EPA announced its long term vision in 2013 to improve implementation of the CWA 303(d) Program. In order to achieve the goals of its vision, U.S. EPA required states to develop a framework for prioritizing impaired waters for TMDL development.

IDEM's 303(d) TMDL Program Priority Framework specifically describes IDEM's methods for prioritizing waters for TMDL planning and watershed restoration. IDEM submitted the framework and its long term schedule to U.S. EPA on July 8, 2015. U.S. EPA has since reviewed IDEM's Priority Framework and, in a letter to IDEM dated September 16, 2015, agreed that it meets the goals of its new long term vision. In the future, IDEM may need to revise its schedule for TMDL development in the short or long term depending on unanticipated factors that can impact IDEM's TMDL monitoring activities or development, or both. In such cases, IDEM will follow the methods described in its Program Priority Framework to determine any necessary changes in order to help ensure ongoing consistency with U.S. EPA's long term vision.

[19] A decision to list a water in Category 4B using 40 CFR Part130.7(b)(1)(i) must be supported by the issuance of technology-based effluent limitations required by Sections 301(b), 306, 307, or other sections of the CWA. A decision to list in Category 4B using Part 130.7(b)(1)(ii) must be supported by the issuance of more stringent effluent limitations required by federal, state, or local authority. The U.S. EPA expects that the state will provide a rationale for why it believes that these effluent limits will achieve WQS within a reasonable period of time. Placement of waters in Category 4B based on Part 130.7(b)(iii) must be supported by the existence of "other pollution control requirements (for example, best management practices) required by local, state, or federal authority" that are stringent enough to implement WQS. EPA expects that the state will demonstrate that these control requirements will achieve WQS within a reasonable period of time.

CALM ATTACHMENT 1

Comparisons of Indiana's Water Quality Criteria to ORSANCO'S Pollution Control Standards and Other Criteria for Making Designated Use Support Assessments for the Ohio River

Table 1-1: Comparison of criteria used to determine recreational use support.

Indicator	Type of Criteria	ORSANCO's Recreational Use Criteria	Indiana's Recreational Use Criteria	Most Stringent Criteria [1]
E. coli	Geometric Mean	Applicable April-October (Recreational Season) May not exceed 130 cfu/100 ml as a 90-day geometric mean based on not fewer than five samples per month	Applicable April-October (Recreational Season) May not exceed 125 cfu/100 ml based on not fewer than five equally spaced samples over a 30-day period. If five equally spaced samples are not available for the calculation of a geometric mean, single sample maximum applies	Indiana
E. coli	Single Sample Maximum	Applicable April-October (Recreational Season) May not exceed 240 cfu/100 ml in more than 25% of samples	Applicable April-October (Recreational Season) May not exceed 235 cfu/100 ml in any one sample in a thirty day period Except In cases where there are at least ten samples at a given site, up to 10% may exceed the single sample maximum If The exceedances are incidental and attributable solely to the discharge of treated wastewater from a wastewater treatment plant as defined in Indiana Code And The geometric mean criterion is met	Indiana

[1]Although Indiana's *E. coli* numeric criteria are slightly more stringent than ORSANCO's, unlike Indiana's WQS, ORSANCO's criteria do not allow exceptions. ORSANCO's assessment methodology also incorporates analysis of single sample results, which provides a more robust assessment than Indiana's combined criteria and assessment methodology can. Indiana, therefore, accepts ORSANCO's assessments of recreational use support for the Ohio River.

Table 1-2: Comparison of criteria used to determine fish consumption use support.

Indicator	Type/Source of Criteria	ORSANCO Criteria	Indiana Criteria	Most Stringent Criteria
Methylmercury in Fish Tissue (µg/L)	Human Health Criterion for Methylmercury (U.S. EPA, 2001)	0.3	0.3	Equally Stringent
Total Mercury in Water (µg/L)	Aquatic Life CAC (4-day average) Outside the Mixing Zone (Indiana) Not to exceed (ORSANCO)	0.012	0.012	Equally Stringent
Dioxin (2, 3, 7, 8-TCDD) in Water (µg/L)	CCC Human Health (30-day average) Outside the Mixing Zone (Indiana) CWA Section 304(a) Human Health Criterion for Priority Pollutants (ORSANCO)	0.000000005	0.0000001	ORSANCO
Polychlorinated Biphenyls (PCBs) in Water (µg/L)[1]	CCC for Human Health (30-day average) Outside the Mixing Zone (Indiana) CWA Section 304(a) Human Health Criterion for Priority Pollutants (ORSANCO)	0.000064[2]	0.00079	ORSANCO

[1] Indiana has two criteria for PCBs that could be used to make fish consumption use assessments, both of which address different ways of preventing exposure through consumption of fish, one by preventing bioaccumulation of the contaminant in the fish and the other to protect against exposure through the consumption of contaminated fish. The criterion shown in the table is the CCC Human Health criterion for waters outside the mixing zone. Human health criteria are calculated for and intended to protect from exposure through public drinking water supplies withdrawn from surface waters and nondrinking water exposures, such as consumption of fish. Therefore, the human health criteria (both ORSANCO's and Indiana's) are appropriate for use in fish consumption assessments. The Aquatic Life CAC of 0.014 µg/L for PCBs could be used in a similar manner as the Aquatic Life CAC for total mercury to prevent bioaccumulation of PCBs in fish. However, the Human Health CCC for PCBs is far more protective and is used instead to make fishable use assessments for the Ohio River. The opposite is true for total mercury, which is why the Aquatic Life CAC of 0.012 µg/L is used instead of the Human Health CCC of 0.15 µg/L.

[2] This criterion applies to total PCBs (the sum of all congener or all isomer or homolog or Arochlor analyses).

Table 1-3: Comparison of metals criteria used to determine aquatic life use support. Hardness is expressed as mg/l of $CaCO_3$.

Metal	Fraction	Acute or Chronic	ORSANCO's Criterion Concentration (µg/L)	ORSANCO's Dissolved Criterion Conversion Factors[1]	Indiana's Criterion Concentration (µg/L)	Indiana's Dissolved Criterion Conversion Factors	Most Stringent Criteria
Mercury[2]	Dissolved (ORSANCO) Total (Indiana)	Chronic	0.91 (Total)	0.85 (Dissolved)	0.012 (Total)	NA	Indiana
Arsenic III[2]	Dissolved[3]	Chronic	150	1.0	190	1	ORSANCO
Cadmium	Dissolved[3]	Chronic	$e^{(0.7409(\ln \text{hardness})-4.719)}$	1.101672 - [ln(hardness) * 0.041838]	$e^{(0.7852[\ln (\text{hardness})]-3.490)}$	1.101672 - [(ln(hardness) (0.041838)]	ORSANCO
Chromium III	Dissolved[3]	Chronic	$e^{(0.819[\ln (\text{hardness})]+0.6848)}$	0.86	$e^{(0.8190[\ln (\text{hardness})]+1.561)}$	0.860	ORSANCO
Chromium VI	Dissolved[3]	Chronic	11	0.962	11	0.962	Equally stringent
Copper	Dissolved[3]	Chronic	$e^{(0.8545(\ln \text{hardness})-1.702)}$	0.960	$e^{(0.8545[\ln (\text{hardness})]-1.465)}$	0.960	ORSANCO
Lead	Dissolved[3]	Chronic	$e^{(1.273(\ln \text{hardness})-4.705)}$	1.46203 - [ln(hardness) * 0.145712]	$e^{(1.273[\ln (\text{hardness})]-4.705)}$	1.46203 - [(ln hardness) (0.145712)]	Equally stringent
Nickel	Dissolved[3]	Chronic	$e^{(0.846(\ln \text{hardness})+0.0584)}$	0.997	$e^{(0.846[\ln (\text{hardness})]+1.1645)}$	0.997	ORSANCO
Selenium	Total	Chronic	5	--	35	--	ORSANCO
Silver	Dissolved[3]	Acute	$e^{(1.72(\ln \text{hardness})-6.59)}$	--	$e^{(1.72[\ln (\text{hardness})]-6.52)}/2$	0.85	Indiana
Zinc	Dissolved[3]	Chronic	$e^{(0.8473(\ln \text{hardness})+0.884)}$	0.986	$e^{(0.8473[\ln (\text{hardness})]+0.7614)}$	0.986	Indiana

[1] The asterisks used in this column are used to denote a multiplication sign.
[2] This criterion is expressed in ORSANCO's Pollution Control Standards as "Not to Exceed" and in Indiana's WQS as a four-day average.
[3] Unless otherwise shown, dissolved metals criteria are calculated as the total recoverable criterion multiplied by the dissolved criterion conversion factor. Assessments are made by comparing dissolved results against the established or calculated criterion.

Table 1-4: Comparison of sulfate and cyanide criteria used to determine aquatic life use support. Hardness is expressed as mg/l of CaCO3.

Indicator	Type of Criteria	ORSANCO's ALUS Criteria	Indiana's ALUS Criteria[1]	Most Stringent Criteria
Free Cyanide[2] (µg/L)	Chronic	5.2	5.2	Equally stringent
Chloride[3] mg/L)	Chronic	No criterion	$177.87*(\text{hardness})^{0.205797}*(\text{sulfate})^{-0.07452}$	Indiana
Sulfate[4] (mg/L): Hardness greater than or equal to 100 mg/L but less than or equal to 500 mg/L And Chloride (mg/L) greater than or equal to 5 mg/L but less than 25 mg/L	Not to Exceed	No criterion	[-57.478+(5.79*hardness) + (54.163*chloride)]*0.65	Indiana
Sulfate[4] (mg/L): Hardness greater than or equal to 100 mg/L but less than or equal to 500 mg/L And Chloride (mg/L) greater than or equal to 25 mg/L but less than or equal to 500 mg/L	Not to Exceed	No criterion	[1276.7+(5.508*hardness) - (1.457*chloride)]*0.65	Indiana
Sulfate[4] (mg/L): Hardness less than 100 mg/L And Chloride (mg/L) less than or equal to 500 mg/L	Not to Exceed	No criterion	500	Indiana
Sulfate[4] (mg/L): Hardness greater than 500 mg/L And Chloride (mg/L) greater than or equal to 5 mg/L but less than 25 mg/L	Not to Exceed	No criterion	[57.478+(5.79*500) + (54.163*chloride)]*0.65	Indiana
Sulfate[4] (mg/L): Hardness greater than 500 mg/L And Chloride (mg/L) greater than or equal to 25 mg/L but less than or equal to 500 mg/L	Not to Exceed	No criterion	[1.276+(5.508*500) - (1.457*chloride)]*0.65	Indiana

[1] The asterisks used in this column are used to denote a multiplication sign.
[2] This criterion is expressed in ORSANCO's Pollution Control Standards as "Not to Exceed" and in Indiana's WQS as a 4-day average.
[3] Indiana's criterion for chloride is a calculated criterion which requires both hardness and sulfate values and is rounded to nearest whole number for the purposes of assessment. ORSANCO's Pollution Control Standards do not contain a chloride criterion for the protection of aquatic life. Therefore, IDEM uses the data collected by ORSANCO for the purposes of making its aquatic life use assessments for the Ohio River.
[4] Indiana's criterion for sulfate is a calculated criterion which requires both hardness and chloride values and is rounded to nearest whole number for the purposes of assessment. ORSANCO's Pollution Control Standards do not contain a

sulfate criterion for the protection of aquatic life. Therefore, IDEM uses the data collected by ORSANCO to calculate the applicable criteria for the purposes of making its aquatic life use assessments for the Ohio River.

Table 1-5: Comparison of ammonia, dissolved oxygen, pH, and temperature criteria used to determine aquatic life use support.

Indicator	Type of Criteria	ORSANCO's ALUS Criteria[1]	Indiana's ALUS Criteria[1]	Most Stringent Criteria
Ammonia (mg/L) applicable March 1 to October 31	Not to Exceed	$0.8876 * [((0.0278/1+10^{7.688-pH}) + (1.1994/(1+10^{pH-7.688})) * (2.126 * 10^{0.028 * (20-Max (T or 7))})]$ Where: T = Temperature in °C Notes: These criteria apply when unionid mussels are present. For purposes of determining the applicable water quality-based limitations on ammonia-nitrogen, unionid mussels shall be presumed to be present at all times in the Ohio River unless the applicant demonstrates to the satisfaction of the permitting authority and ORSANCO that mussels are absent.	$[((0.0577/(1+10^{7.688-pH}))) + (2.487/(1-10^{pH-7.688}))] * MIN (2.85, (1.45*10^{0.028*(25 - T)})$ Where: T = Temperature in °C Notes: For the above equation, multiply the parenthetical equation by 2.85 when T is less than or equal to 14.51ºC. When T is greater than 14.51ºC, multiply the parenthetical equation by $(1.45 * 10^{0.028*(25-T)})$	ORSANCO
Dissolved Oxygen (mg/L) applicable April 15 to June 15	Not to Exceed	Minimum concentration 5.0 at all times	Average concentration at least 5.0 per calendar day and a minimum concentration of 4.0 at all times	ORSANCO
Dissolved Oxygen (mg/L) applicable June 16 to April 14	Not to Exceed	Average concentration at least 5.0 per calendar day and a minimum concentration of 4.0 at all times	Average concentration at least 5.0 per calendar day and a minimum concentration of 4.0 at all times	Equally stringent
pH (standard units)	Not to Exceed	No value less than 6.0 nor greater than 9.0	No value less than 6.0 nor greater than 9.0	Equally stringent
Temperature (expressed in °C and °F)	Not to exceed	Allowable values expressed as Period Averages and Maximum Temperatures	Allowable values expressed as Maximum Temperatures	ORSANCO[2]

[1] The asterisks used in this column are used to denote a multiplication sign.
[2] Both ORSANCO's Pollution Control Standards and Indiana's WQS articulate maximum allowable temperatures. ORSANCO's standards also include allowable period average temperatures, which are more stringent than the maximum allowable temperatures in either set of standards.

Table 1-6: Comparison of human health criteria and other criteria used to determine public water supply use support.

Parameter	ORSANCO's Criterion Concentration	Indiana's Criterion Concentration	Most Stringent Criteria
Antimony (Total)	5.6 µg/L	146 µg/L	ORSANCO
Arsenic III (Total)	10 µg/L	0.022 µg/L	Indiana
Barium (Total)	1,000 µg/L	1,000 µg/L	Equally stringent
Beryllium (Total)	No criterion	0.068 µg/L	Indiana
Cadmium (Total)	No criterion	10 µg/L	Indiana
Copper (Total)	1300 µg/L	No criterion	ORSANCO
Mercury (Total)	0.012 µg/L	0.14 µg/L	ORSANCO
Nickel (Total)	610 µg/L	13.4 µg/L	Indiana
Selenium (Total)	170 µg/L	10 µg/L	Indiana
Silver (Total)	50 µg/L	50 µg/L	Equally stringent
Thallium (Total)	0.24 µg/L	48 µg/L	ORSANCO
Zinc (Total)	7400 µg/L	No criterion	ORSANCO
Cyanide (Total)	140 µg/L	200 µg/L	ORSANCO
Fluoride	1.0 mg/L	1.0 mg/L[1]	Equally stringent
Nitrogen (as Nitrate-Nitrite)	10 mg/L	10 mg/L	Equally stringent
Nitrite	1 mg/L	1 mg/L	Equally stringent
Sulfate	250 mg/L[2]	250 mg/L	Equally stringent
Chloride	250 mg/L	250 mg/L	Equally stringent
Phenol	0.005 mg/L[2]	3.5 mg/L	ORSANCO
Total Dissolved Solids	500 mg/L[2]	750 mg/L	ORSANCO
Specific Conductance	No criteria	1200 micromhos/cm	Indiana
Fecal Coliform	May not exceed 2,000 cfu/100 ml as a geometric mean calculated from five samples collected over a one-month period	May not exceed: 5,000 cfu/100 ml as a monthly average value Or 5,000 cfu/100 ml in greater than 20% of samples collected in a given month Or 20,000 cfu/100 ml in less than 5% of all samples collected in a given month	ORSANCO

[1] This criterion is applicable to all waters outside the mixing zone and to all designated uses.

[2] This is criterion is not a human health criterion. Rather, it is identified as a taste and odor protection criterion as defined in Section 2.2 of ORSANCO's PCS.

CALM ATTACHMENT 3

Derivation of Criteria Values for Concentrations of Mercury and PCBs in Fish Tissue

U.S. EPA stipulates that the risk assessment parameters used to categorize fish tissue contaminant data must be at least as protective as those used in the WQS-based fish concentrations. The equation for calculating a fish tissue criterion for PCBs utilizes the guidance provided by U.S. EPA for calculating screening values for target analytes (http://www.epa.gov/waterscience/fishadvice/volume1/v1ch5.pdf). U.S. EPA's Office of Water recommends the use of this calculation method because it is the basis for developing current water quality criteria for the protection of human health. The general equation used for calculating Screening Values (SVs) for carcinogens in fish tissue is derived from this guidance and is as follows:

SVc = [(RL/CSF)*BW]/CR ***Equation 3-1***

where:
SVc = Screening value for a carcinogen (mg/kg; ppm)
RL = Maximum acceptable risk level (dimensionless)
CSF = Oral cancer slope factor $(mg/kg\text{-}d)^{-1}$
BW = Mean body weight of the general population (kg)
CR = Mean daily consumption rate of species of interest (kg/d)

- The asterisk is used to denote a multiplication sign.

In determining a screening value or fish tissue criterion for PCBs, the same assumptions and parameters used for calculating human health water quality criteria were applied. These parameters include a BW of 70 kg, CSF (of 2.0 $(mg/kg\text{-}d)^{-1}$, RL of 10^{-5}, and CR of 17.5 (g/d).

The general equation for calculating a fish tissue screening value for PCBs is:

$$\textit{Fish Tissue Screening Value (mg/kg)} = \frac{\left[\dfrac{Cancer\ Risk\ Level}{q1 * \left((mg/kg/d)^{-1}\right)}\right] \times Body\ Weight\ (kg)}{Fish\ Consumption\ (kg/d)} \qquad \textit{Equation 3-2}$$

Therefore,
Cancer risk level (the RL value from equation 1) = 10^{-5}
q1 (the CSF from equation 1) = of 2.0 $(mg/kg\text{-}d)^{-1}$
BW (same in both equations) = 70 kg
Fish Consumption (CR in equation 1) = 17.5 (g/d) or 0.0175 (kg/d)

- The asterisk is used to denote a multiplication sign.

$$\textit{PCB Fish Tissue Screening Value (mg/kg)} = \frac{\left[\dfrac{1E-05}{2.0\ (mg/kg/d)^{-1}}\right] \times 70\ (kg)}{0.0175\ (kg/d)} = 0.02\ (mg/kg) \qquad \textit{Equation 3-3}$$

A tissue-based criterion eliminates the need for a bioaccumulation factor in the criterion calculation while PCB exposure from drinking water is negligible (http://www.great-lakes.net/humanhealth/lake/superior.html).

CALM ATTACHMENT 4

Comparison of Water Quality Assessment Criteria and Benchmarks for IDEM's Clean Water Act Public Water Supply Assessments and the Safe Drinking Water Act Maximum Contaminant Levels for Treated Drinking Water

Table 4-1: Water quality assessment criteria and benchmarks used in assessments for public water supply use support. This table also provides maximum contaminant levels (MCLs) regulated under the Safe Drinking Water Act (SDWA) for the purposes of comparison only – MCLs are not used for the purposes of assessment.

Vinyl Chloride		20 µg/L				2 µg/L
Halomethanes (all compounds)		1.9 µg/L				

*Indicates a treatment technique (TT) action Level as opposed to MCL.

APPENDIX H:

COMPREHENSIVE AQUATIC LIFE USE AND RECREATIONAL USE ASSESSMENTS

Comprehensive aquatic life use and recreational use assessments are made with data collected through IDEM's Probabilistic Monitoring Program.

This report provides IDEM's comprehensive basin aquatic life use assessments, which are based on site-specific assessments using chemical results in combination with fish and macroinvertebrate community data (Table 1). Comprehensive aquatic assessments for each basin were calculated from site-specific assessment results in the following manner:

- Percent attaining = biological assessment results indicating full support (IBI>35 and/or mHab>35) and no corresponding chemical parameter violations;
- Percent not attaining = biological assessment results indicating non-support (i.e. impairment) (IBI<35 and/or mHab<35) and/or corresponding chemical parameter violations.

IDEM uses independent applicability in its comprehensive basin aquatic life use assessments. Therefore, either biological or chemical results indicating impairment were treated as non-supporting in determining attainment for the basin.

Updated comprehensive basin recreational use assessment results are also provided (Table 2) and were calculated using site-specific assessments results in a similar manner.

- Percent attaining = E. *coli* assessment results indicating full support (geometric mean <125 colony forming units per 100 milliliters);
- Percent not attaining = E. *coli* assessment results indicating non-support (i.e. impairment) (geometric mean >125 colony forming units per 100 milliliters);

Percent attainment and percent non-attainment values are calculated by IDEM staff using commands provided by U.S. EPA National Health and Environmental Effects Research Laboratory, Corvallis, Oregon (www.epa.gov/nheerl/arm/analysispages/techinfoanalysis.htm) as well as the R Development Core Team (2005). R: A language and environment for statistical computing. R Foundation for Statistical Computing, Vienna, Austria. ISBN 3-900051-07-0, URL http://www.R-project.org.

Table 1: Comprehensive basin aquatic life use assessments showing attainment results calculated using the probabilistic monitoring design.

APPENDIX I:

TREND AND TROPHIC STAUS OF INDIANA'S LAKES

Table I-1: Definitions for acronyms used to describe trends and trophic state.

Acronym	Descripton	
Carlson Trophic State Index		
TSI (CHL)	Trophic State Index score for Chlorophyll *a*	
TSI (TP)	Trophic State Index score for Total Phosphorus	
TSI (SD)	Trophic State Index score for Secchi Depth	
rophic State		
O	Oligotrophic	TSI (CHL) Score <40
M	Mesotrophic	TSI (CHL) Score 40-50*
E	Eutrophic	TSI (CHL) Score 50-70
H	Hypereutrophic	TSI (CHL) Score >70
U	Unknown	No TSI (CHL) score available
Trend		
I	Improving	
S	Stable	
D	Degrading	
F	Fluctuating	
U	Unknown	

*Lakes with a TSI (CHL) score of 50, which is on the boundary between mesotrophic and eutrophic conditions, are evaluated with their corresponding TSI scores for TP and SD along with any other available information and classified based on the best professional judgment of IDEM scientists.

Table I-2: Trophic Status and Trends of Indiana Lakes based on Carlson TSI (CHL) scores. Scores for TSI (SD) and TSI (TP_{Avg}) are provided for the purposes of comparison. Lakes marked with an asterisk (*) have been monitored by the Indiana Clean Lakes Program but is not yet geospatially indexed (assigned an Assessment Unit ID) and entered ATTAINS database. The basin, hydrologic unit code, and size of these waterbodies must be verified through the reach indexing process.

APPENDIX J:

IDEM'S NOTICE OF PUBLIC COMMENT PERIOD FOR THE 2020 DRAFT 303(D) LIST AND CONSOLIDATED ASSESSMENT AND LISTING METHODOLOGY (CALM)

DEPARTMENT OF ENVIRONMENTAL MANAGEMENT

NOTICE OF COMMENT PERIOD

Office of Water Quality
Notice of Public Comment Period for the 2020 List of Impaired Waters
and Consolidated Assessment and Listing Methodology
under Section 303(d) of the Clean Water Act
Document #20-6

PURPOSE OF NOTICE

The Indiana Department of Environmental Management (IDEM) is soliciting public comment for the development of its draft 2020 303(d) List of Impaired Waters and the Consolidated Assessment and Listing Methodology (CALM) used to develop it. Any person having water quality data to support or refute the listing of a specific waterbody or to add a waterbody to the list will be able to provide that information to IDEM during the public comment period. Comments and suggestions regarding the CALM will also be accepted during this period. IDEM will review and respond to all comments received. IDEM will submit its finalized 2020 303(d) List of Impaired Waters as part of its 2020 Integrated Report to U.S. EPA by April 1, 2020. All public comments received during the public comment period and IDEM's responses will be included in its April 1, 2020 submittal to the United States Environmental Protection Agency (U.S. EPA).

Appendices 1 and 2 (IDEM's CALM and TMDL Priority Framework, respectively) are available in this notice. Appendices 3 through 11, which contain supporting tables are provided on IDEM's website at: https://www.in.gov/idem/nps/2647.htm in a spreadsheet format to provide the public the ability to more effectively search for information regarding specific waters of interest. Anyone experiencing difficulty accessing these tables can obtain a copy by contacting Jody Arthur in the Watershed Assessment and Planning Branch, Office of Water Quality, (317) 308-3179 or (800) 451-6027 (in Indiana).

AUTHORITY: IC 13-18-2-3.

SUBJECT MATTER
BASIC PURPOSE AND BACKGROUND

The IDEM Office of Water Quality (OWQ) is preparing to update its 303(d) List of Impaired Waters, as required by Section 303(d) of the federal Clean Water Act (CWA) and the Water Quality Planning and Management regulation contained in the Code of Federal Regulations (CFR) at 40 CFR Part 130. Under the CWA, each state is required to assemble all existing and readily available water quality-related data and information for use in assessing its waters for compliance with the state's water quality standards (WQS). States may adopt national water quality criteria or develop state-specific criteria, or do both, to protect the uses described in their WQS. In Indiana, these uses include recreational uses, aquatic life use, and the use of some waters as a drinking water resource. States are required to prepare and make public a list of waters that do not meet the WQS and the methodology used to evaluate the data and determine impairment status. The 303(d) List of Impaired Waters will identify the following:

The reach or reaches of the stream or river waterbody that is impaired or the lake that is impaired (lakes are evaluated as a single waterbody).

The pollutant or pollutants that do not meet the WQS, thereby causing the impairment.

A schedule for development of a Total Maximum Daily Load (TMDL).

A TMDL evaluation is a process that quantifies the amount of a specific pollutant that a waterbody can assimilate and still meet WQS. A description of what constitutes a pollutant is provided in Section 502(6) of the CWA and includes materials such as sewage, chemical wastes, biological materials, and wastes from industrial, municipal, and agricultural operations. The definition also encompasses drinking water contaminants that are regulated under Section 1412 of the Safe Drinking Water Act (SDWA). A TMDL is a written, quantitative assessment that accomplishes the following:

Identifies how much of the pollutant is coming from point sources and nonpoint sources.

Specifies the amount of pollutant reduction necessary from each source in order to meet the WQS set for that pollutant.

Lays the groundwork for developing and implementing a plan to reduce the amount of the pollutant coming from each source.

As part of IDEM's TMDL process, the public is invited to participate in the plan to develop and implement the TMDL.

Status of U.S. EPA Approval of Indiana's 303(d) List of Impaired Waters

On May 9, 2019, U.S. EPA notified IDEM that it had consolidated its review of Indiana's 2012, 2014, 2016, and 2018 303(d) lists. In its approval letter, U.S. EPA concluded that IDEM has met the requirements of Section 303(d) of the federal CWA and all applicable requirements in the CFR for all waters submitted on its 303(d) lists to date. However, U.S. EPA has deferred action on certain waters with regard to metals issues that U.S EPA and IDEM have yet to resolve.

Applicable Federal Law

IDEM develops its 303(d) List of Impaired Waters pursuant to Section 303(d) of the federal CWA. This notice serves as a solicitation for any additional water quality-related information that may be used to further develop and refine the 2020 303(d) list and satisfies the federal Water Quality Planning and Management regulation in 40 CFR Part 130.

REQUEST FOR PUBLIC COMMENTS

At this time, IDEM solicits the following:

(1) Water quality data or water quality-related information to support or refute the listing of a specific waterbody or to add a waterbody to the 303(d) list.

(2) Comments and suggestions regarding the CALM.

Comments may be submitted in one of the following ways:

(1) By mail or common carrier to the following address:

LSA Document #20-6 2020 Draft 303(d) List of Impaired Waters
Karla Kindrick, Administrative Assistant
Rules Development Branch
Office of Legal Counsel
Indiana Department of Environmental Management
Indiana Government Center North
100 North Senate Avenue
Indianapolis, IN 46204-2251

(2) By facsimile to (317) 233-5970. Please confirm the timely receipt of your faxed comments by calling the Rules Development Branch at (317) 232-8922.

(3) By electronic mail to kkindric@idem.in.gov. To confirm timely delivery of your comments, please request a document receipt when you send the electronic mail. PLEASE NOTE:

Electronic mail comments will NOT be considered part of the official written comment period unless they are sent to the address indicated in this notice.

(4) Hand delivered to the receptionist on duty at the thirteenth floor reception desk, Office of Legal Counsel, Indiana Government Center North, 100 North Senate Avenue, Indianapolis, Indiana.

Regardless of the delivery method used, each comment document must clearly specify the LSA document number at the top of this notice so that IDEM can properly associate your comment with the action it is intended to address.

COMMENT PERIOD DEADLINE

All comments must be postmarked, faxed, or time stamped not later than April 28, 2020. Hand-delivered comments must be delivered to the appropriate office by 4:45 p.m. on the above-listed deadline date.

Additional information regarding this notice may be obtained from Jody Arthur in the Watershed Assessment and Planning Branch, Office of Water Quality, (317) 308-3179 or (800) 451-6027 (in Indiana).

DEVELOPMENT OF INDIANA'S 2020 303(D) LIST OF IMPAIRED WATERS

For the development of the 2020 Draft 303(d) List of Impaired Waters, IDEM has followed, to the degree possible, the 305(b) and 303(d) reporting methods outlined in U.S. EPA "Guidance for 2004 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act" (U.S. EPA, 2003) and the additional guidance provided in U.S. EPA memorandums containing information concerning CWA Sections 303(d), 305(b), and 314 integrated reporting and listing decisions for the 2006, 2008, 2010, 2012, 2014, 2016, and 2018 cycles (U.S. EPA, 2005-2017).

For the 2018 cycle, U.S. EPA issued a memorandum focusing primarily on the transition of state water quality assessment reporting systems, including Indiana's Assessment Database (ADB) to the new, federal Assessment and Total Maximum Daily Load Tracking and Implementation System (ATTAINS) online (U.S. EPA, 2017). U.S. EPA's goal for this transition is to more effectively analyze and share state water quality assessment information across its water programs and to measure progress toward its Strategic Plan.

Indiana formally submitted its finalized 2018 303(d) list to U.S. EPA via ATTAINS on June 18, 2019. The draft 2020 303(d) list contained in this notice was developed with the water quality assessment data now in ATTAINS. IDEM's interpretation of the data and listing decisions take into account U.S. EPA's guidance and IDEM's current CALM. This notice identifies all changes to the 303(d) list that have been made since U.S. EPA's May 9, 2019, approval of Indiana's 2012-2018 303(d) lists.

Indiana's Consolidated List

One aspect of U.S. EPA's guidance calls for a comprehensive listing of all monitored or assessed waterbodies in the state based on the state's assessment and listing methodology. Each waterbody assessment unit (AU), which may consist of an entire waterbody or a segment of a larger waterbody, is to be placed in one or more of five categories depending on the degree to which it supports designated uses. U.S. EPA guidance encourages states to place a waterbody AU in additional categories as appropriate in order to more clearly illustrate where progress has been made in TMDL development and other restoration efforts. Therefore, waterbodies are assigned to one category for each of the following

designated uses: aquatic life use, recreational use, fish consumption[1], and public water supply[2].

A detailed explanation of the five categories is provided in IDEM's CALM in Appendix 1. The following is a summary of the five categories:

Category 1 The available data or information, or both, indicate that all designated uses are supported and no use is threatened.

Category 2 The available data or information, or both, indicate the individual designated use is supported.

Category 3 The available data or other information is insufficient to determine if the individual designated use is supported.

Category 4 The available data or information, or both, indicate that the individual designated use is impaired or threatened but a TMDL is not required due to one or more of the following reasons:

A. A TMDL for one or more pollutants has been completed and approved by U.S. EPA and is expected to result in attainment of all applicable WQS.

B. Other pollution control requirements are reasonably expected to result in the attainment of all WQS applicable to the pollutant or pollutants in a reasonable period of time.

C. The impairment is not caused by a pollutant and, as such, does not require a TMDL.

Category 5 The available data or information, or both, indicate the individual designated use is impaired or threatened, and a TMDL is required due to one or both of the following reasons:

A. The individual designated use is impaired or threatened by one or more pollutants and requires a TMDL.

B. The waterbody is impaired due to the presence of mercury or PCBs, or both, in the edible tissue of fish at concentrations exceeding Indiana's human health criteria for these contaminants.

The 303(d) List of Impaired Waters consists of all impairments listed in Category 5. This category includes waters where the WQS is not attained because the waterbody AU is impaired or threatened by one or more pollutant(s) for each of which a TMDL is required. However, due to the complex nature of the contaminants involved, IDEM categorizes all fish tissue-related impairments into Category 5B (a state-defined subcategory similar to U.S EPA's 5M subcategory) deferring development of a conventional TMDL to allow other contaminant clean-up efforts to remedy such impairments.

U.S. EPA Rules for Delisting Impairments

U.S. EPA's most recent guidance does not change existing rules for listing and delisting impairments from Category 5. The existing regulations still require states, at the request of the U.S. EPA's Regional Administrator, to demonstrate good cause for not including impairments on the 303(d)

[1] Fish consumption is not a designated use in Indiana's WQS. IDEM assesses Indiana waters for fish consumption pursuant to current U.S. EPA policy and in keeping with CWA goals, which are reflected in Indiana's WQS (327 IAC 2-1-1.5 and 2-1.5-3.

[2] The designation for public water supply use is applicable only to waters that serve as a routine or emergency source of water for a public water system.

list that were included on previous 303(d) lists (pursuant to 40 CFR 130.7(b)(6)(iv)). In general, IDEM will consider delisting an impairment only if one of the following is true:

New data indicate that WQS are now being met for the specific cause of impairment to the AU under consideration.

The assessment or listing methodology, or both, has changed, and the AU would not be considered impaired in accordance with the new methodology.

An error is discovered in the sampling, testing, or reporting of data that led to an inappropriate listing.

IDEM determines that another program other than the TMDL program is better suited to address the water quality problem.

IDEM determines that the water quality problem is not caused by a pollutant for which a TMDL can be developed.

A TMDL has been approved by U.S. EPA for the impairment.

IDEM's Methods for Prioritizing TMDL Development

The CWA does not clearly define the timeline for TMDL development. However, IDEM works with U.S. EPA Region 5 every 303(d) listing cycle to determine IDEM's short term TMDL schedule, which identifies the TMDLs to be developed for the next cycle. For the 2020 cycle, IDEM's TMDL development has been focused on two watersheds:

Lower Salt Creek Watershed Salt Creek – TMDL approved on September 10, 2018.

Lower East Fork White River Watershed – TMDL currently under development.

IDEM will submit its finalized list of TMDLs developed for the 2020 cycle with the submittal of its 2020 Integrated Report.

IDEM's long term schedule for TMDL development was developed in accordance with the methods described in IDEM's TMDL Program Priority Framework (Appendix 2). This framework was developed in 2015 and describes IDEM's methods for prioritizing waters for TMDL planning and watershed restoration. It also includes the agency's long term TMDL development schedule, which identifies the watersheds in which TMDLs will be developed through the 2022 cycle. More detailed information on IDEM's 303(d) TMDL Program Priority Framework and the long term schedule for TMDL development can be found in IDEM's CALM (Appendix 1).

As with IDEM's short term schedule, the watersheds identified on IDEM's long term schedule may change based on unanticipated circumstances. While the specific watersheds IDEM focuses on may change, IDEM will prioritize TMDL development using the methods described in its Program Priority Framework to help ensure consistency with U.S. EPA's long term vision.

How Impairment Information Is Organized on Indiana's 303(d) List of Impaired Waters

IDEM now maintains assessment information for all Indiana waters in ATTAINS for CWA 305(b) reporting and 303(d) listing purposes and to provide assessment information when requested by the public. Every lake, stream, or reach of stream in ATTAINS is assigned a unique assessment unit identification (AUID).

Generally, each lake or reservoir is considered one AU and is assigned a single AUID. For flowing waters, the sizes of AUs vary based on a number of factors such that a single AUID may represent an entire stream or only one reach of it. IDEM's methods for defining representative AUs are discussed in detail in the CALM.

On the 303(d) list, impairments are listed individually in order to achieve consistency with the way U.S. EPA tracks TMDL development and to facilitate more effective planning by IDEM. Therefore, a single AU may appear on the 303(d) list for one or more impairments.

Revisions to Indiana's Reach Index for Mapping Impairments

IDEM defines the geographical extent and location of each AU within a given 12 or 14 digit hydrologic unit code (HUC) for mapping purposes through a process called reach indexing. Reach indexing uses software tools that work within geographical information systems (GIS) applications to delineate one or more AUs for a given waterbody and to "key" these AUs to the National Hydrography Dataset (NHD)[3], which allows them to be mapped. This "key" is the Reach Index, which facilitates mapping of Indiana's 305(b) assessments and 303(d) listings in GIS applications and incorporating this information into IDEM's ADB and U.S. EPA's national databases.

IDEM developed its original Reach Index using the NHD at medium resolution (1:100,000 scale). When the NHD became available for Indiana in high resolution (1:24,000 scale), IDEM found that a significantly greater number of first and second order streams[4] appeared at this scale than were visible in its original Reach Index. These small streams and stream networks are an important component of the hydrology in their watersheds and can have significant effects on water quality in larger streams.

In order to provide a more comprehensive picture of water quality conditions throughout Indiana, IDEM worked to revise its Reach Index over the course of several integrated reporting cycles to incorporate the high resolution NHD. IDEM finalized its High Resolution (HR) Reach Index in 2017. While IDEM may in the future make additional changes, any revisions of IDEM's HR Reach Index will be limited and conducted only when needed to support National Pollutant Discharge Elimination System (NPDES) permit development, such as the application of site-specific criteria, or to support other IDEM OWQ program needs.

Changes in the Reach Index can trigger changes in the 303(d) list. In keeping with U.S. EPA policy, as reaches were re-indexed, any impairments identified for the original reach were applied to all new reaches resulting from re-indexing. However, the original assessment information may or may not be representative of every one of the new reaches to which it was applied. Given this, IDEM continues to evaluate the original assessment information for any AUID re-indexed to ensure its proper application to newly indexed AUs and expects to make changes to its 303(d) list in future reporting cycles.

IDEM will provide a full record of all segmentation changes to date to U.S. EPA with its submittal of its 2020 Integrated Report to facilitate the tracking of information pertaining to the 303(d) list and TMDL development. Changes to the 303(d) list based on re-indexing are identified for the 2020 cycle in Appendices 8 and 9.

HOW IDEM DEVELOPED THE DRAFT 2020 303(d) LIST

Each 303(d) list builds upon the previous list. To develop the draft 2020 303(d) list in this notice, IDEM used as its basis the approved 2018 303(d) list. The tables in this notice identify all impairments removed from and added to Category 5 as well as those added to Category 4A based on the approval of TMDLs developed for them. Tables summarizing all changes made to date for the 2020 cycle are also provided in this notice.

IDEM's Consolidated Assessment and Listing Methodology

The impairments on Indiana's draft 303(d) list were identified through IDEM's CWA Section

---

[3] The NHD is a database created by U.S. EPA and the United States Geological Survey that provides a comprehensive coverage of hydrographic data for the United States. It uniquely identifies and interconnects the stream segments that comprise the nation's surface water drainage system and contains information for other common surface waterbodies such as lakes, reservoirs, estuaries, and coastlines.

[4] Stream order is a measure of the relative size of streams. Streams sizes range from the smallest "first-order" stream (for example, a small creek) to the largest or "twelfth-order" stream (for example, the Amazon River).

305(b) water quality assessment process. Water quality assessments are made for each designated use and waterbody type by comparing the available data with the applicable WQS following the methods described in IDEM's Consolidated Assessment and Listing Methodology (CALM), which is provided in Appendix 1.

IDEM's CALM can change from cycle to cycle for one or more of the following reasons:

New science or other information becomes available to support the development of new assessment methods or revisions to existing methods.

Changes in Indiana's water quality standards, such as the adoption of new water quality criteria, make a change in the applicable assessment methodology necessary.

IDEM identifies a change that will result in more accurate or representative water quality assessments.

For the 2020 cycle, IDEM added a new parameter, percent oxygen saturation, to the suite of parameters the agency uses to assess the degree to which nutrient enrichment may be impacting water quality in a given stream. The original suite of parameters included two values for dissolved oxygen, 4.0 mg/l and 12 mg/l, which together represented the range of expected values for a non-impacted stream. Values outside of these benchmarks were considered representative of high diurnal swings in oxygen concentrations, which is a common indicator of excess nutrient enrichment in streams.

When IDEM re-evaluated the data for nutrient impairments based in part on dissolved oxygen results, it was found that most of the dissolved oxygen values exceeding 12 mg/l were collected in winter months. In colder months, higher dissolved oxygen values would be expected due to the inverse relationship between water temperature and dissolved oxygen.

The ability of cold water to "hold" more dissolved oxygen than warm water makes the time of year in which a sample is collected an important factor to consider when evaluating the nutrient condition of a stream. Dissolved oxygen values greater than 12 mg/l in samples collected during winter may be driven more by temperature than any increase in the photosynthesis of excess algae resulting from nutrient enrichment. For this reason, IDEM has determined that using the percent saturation of dissolved oxygen is a better indicator of photosynthetic activity than a single value for dissolved oxygen concentration and, thus, more representative of nutrient enrichment.

When evaluating dissolved oxygen to determine if nutrient enrichment is impacting a given stream, IDEM now uses a percent saturation value for dissolved oxygen instead of its concentration value. To determine the appropriate value to use, IDEM reviewed several years' worth of data collected from IDEM's fixed station sites, which are sampled year round. This analysis revealed values above 120 percent dissolved oxygen saturation were strongly correlated with exceedances of other nutrient benchmarks. Based on this, IDEM considers dissolved oxygen results exceeding 120 percent saturation, when combined with exceedances of one or more other nutrient benchmarks in the CALM, representative of nutrient impairment.

IDEM's Use of External Data

Most of the data used in IDEM's CWA Section 305(b) water quality assessments comes from IDEM's water monitoring programs. However, Section 303(d) of the CWA requires that states consider all readily available data sources in the preparation of their 303(d) lists. On September 23, 2015, IDEM launched its External Data Framework (EDF) to provide a systematic, transparent, and voluntary means for external organizations to share the water quality data they collect with IDEM for potential use in its CWA assessment and listing processes.

IDEM has received data sets from the Army Corps of Engineers and the Marion County Health Department through the EDF and is currently evaluating them for potential use in IDEM's water quality assessments and 303(d) listing processes.

To utilize external data for 303(d) listing, the data must satisfy certain quality requirements. Therefore, IDEM is also working to develop an online tool to assist EDF participants (and anyone else collecting water quality monitoring data) to better document the quality of the data they collect. The Online Quality Assurance Project Plan (QAPP) Tool will allow users to fill out a pre-formatted QAPP template that includes all the necessary elements that the organization collecting the data or any secondary users of the data set (including IDEM) would need to determine whether it is reliable for their needs. The tool will allow users to develop their QAPPs over as many sessions as they need, will provide an extensive library of documents to help the user understand the information needed in different sections of the QAPP, and will allow users to e-mail IDEM staff directly with any QAPP-related questions they may have.

While the QAPP tool will be available to any organization conducting water quality monitoring, IDEM is developing it primarily for use by EDF participants to help them provide sufficient quality assurance documentation with their data submittals. IDEM expects to complete development of the QAPP tool by late 2020.

The public is invited to explore IDEM's EDF website and its Secondary Data Portal to learn more about the EDF and how to submit water quality data for potential use in the development of IDEM's 303(d) list for future cycles:

IDEM Office of Water Quality's EDF website: http://in.gov/idem/cleanwater/2485.htm

IDEM Office of Water Quality's Secondary Data Portal:
http://www.hoosierriverwatch.com/portal/

The public is also encouraged to use this comment period as an opportunity to provide feedback to IDEM regarding the EDF. All comments received during the public comment period for the 2020 303(d) list will be reviewed and evaluated to identify potential improvements to the process or to suggest any changes in IDEM's policies regarding the use of external data in its decision-making processes.

Impairments Removed from Category 5A as a Result of TMDL Development

For the 2020 cycle, IDEM submitted a TMDL report for the Lower Salt Creek Watershed in south central Indiana, which was approved by U.S. EPA on September 10, 2018. IDEM moved forty two (42) impairments previously listed in Category 5 to Category 4A based on this TMDL report. IDEM also has done a thorough review of its Category 4A waters as a part of its transition to the ATTAINS database and has moved an additional sixteen (16) impairments associated with previously approved TMDLs from Category 5 to Category 4A.

To facilitate public review of the resulting changes to the 303(d) list, all impairments moved into Category 4A for the 2020 cycle are identified in Appendix 3. The TMDL reports for approved TMDLs, along with information on their development, can be found online at:
http://www.in.gov/idem/nps/2347.htm.

Impairments Removed from Category 5 Based on New or Revised Assessments Indicating that Applicable WQS Are Being Met

This section includes impairments removed from Category 5 based on more recent data or other information that have become available since U.S. EPA approval of IDEM's 2018 303(d) list, some through new assessments and others through review of existing assessment information. IDEM has identified a total of fifteen (15) previously identified impairments for which WQS are now being met (Appendix 4). These impairments have been removed from Category 5A for the 2020 cycle.

Impairments Added to Category 5 Based on New or Revised Assessments

This section includes impairments added to Category 5 based on more recent data or other

information that have become available since IDEM's 2018 303(d) list was approved by U.S. EPA.

For a lake or stream to be listed, IDEM must have sampling data representative of that waterbody, and the data collected must support 303(d) listing in accordance with IDEM's CALM.

The impairments added to the 303(d) list based on new or revised assessments are located mostly in the Upper Illinois River basin, which was sampled by IDEM in 2017, and the Great Lakes sampled in 2018. Based on these assessments, IDEM has added a total of eighteen (18) impairments to Category 5 (Appendix 5).

Changes to Category 5 Based on IDEM's Ongoing Review to Identify Errors and Omissions and to Ensure Consistency with Indiana's WQS

IDEM routinely reviews its 303(d) list for errors and omissions, and to ensure consistency with Indiana's WQS and the information IDEM maintains in its ADB. For the 2020 cycle, IDEM has identified four (4) impairments that should be removed from Category 5 (Appendix 6) and a total of thirty six (36) impairments that should be added (Appendix 7).

Impairments Removed from Category 5 Based on Changes to Indiana's High Resolution Reach Index

In keeping with U.S. EPA policy, no impairment may be delisted without good cause, which is described in this notice under the heading "Indiana's Consolidated List". Re-indexing alone does not constitute good cause for delisting. Although retiring an impaired AU requires delisting of its impairments, it is IDEM's policy to add those impairments back to the 303(d) under their new AUIDs unless IDEM can demonstrate good cause to do otherwise.

IDEM expects to make very few changes to the HR Reach Index in the future, and most of the changes resulting from IDEM's high resolution re-indexing effort have been reported in previous cycles. However, IDEM does expect to make additional changes to its 303(d) list in the future as IDEM works to evaluate the original assessment information associated with re-indexed AUs to ensure its proper application to newly indexed AUs. For the 2020 cycle, IDEM has removed a total of eighteen (18) impairments from Category 5 based on re-indexing (Appendix 8). Most of these impairments were already listed in Category 5 under their new AUIDs. However, three (3) impairments were not and were added back under their new AUs (Appendix 9).

Summary of Changes to Indiana's 303(d) List for the 2020 Cycle

Table 1 summarizes the proposed removals from and additions to Indiana's 303(d) list and the impact of these changes in terms of:

The total number of impairments and the total number of individual waterbodies impaired. Note that these values differ because a single waterbody may be listed for one or more individual impairments.

The total number of impairments and individual waterbodies impaired, broken out by waterbody type (streams versus lakes).

The total number of stream miles and lake acres impaired.

Table 2 provides a comparison of the approved 2018 303(d) list and the draft 2020 303(d) list in terms of the types of changes made (removals and additions to Category 5).

Table 3 provides a simple comparison of the approved 2018 303(d) list and the draft 2020 list contained in this notice.

Table 4 provides a comparison of the different types of impairments identified on Indiana's 303(d) list, both for 2018 and now.

A Comprehensive Picture of Impairment to Indiana Waters

The 303(d) list is a subset of Indiana's Consolidated List, which provides a comprehensive

accounting of all assessment information IDEM has for Indiana waters to date including waters that have been found fully supporting of one or more designated uses (Categories 1 and 2), those that have yet to be assessed (Category 3), and waters that are impaired (Categories 4 and 5). The 303(d) list is comprised of Category 5 impairments only, which includes Category 5A (water-column impairments) and Category 5B (fish tissue impairments).

While this notice pertains specifically to changes made to Category 5 impairments, it is important to note that in order to gain a fully comprehensive view of all impaired waters in Indiana, one must also consider Category 4 waters, which are impaired but do not require a TMDL for one of the following reasons:

Category 4A – A TMDL for one or more pollutants has been completed and approved by U.S. EPA and is expected to result in attainment of all applicable WQS.

Category 4B – Other pollution control requirements are reasonably expected to result in the attainment of all WQS applicable to the pollutant or pollutants in a reasonable period of time.

Category 4C – The impairment is not caused by a pollutant and, as such, does not require a TMDL.

Indiana's draft 2020 303(d) list, which includes all Category 5 impairments, is provided in Appendix 10, and Appendix 11 identifies all Category 4 waters. Together, these appendices provide the most comprehensive assessment of impairment of Indiana waters to date.

With the combined changes made for the 2020 cycle, Indiana's draft 2020 303(d) List of Impaired Waters identifies a total of six thousand six hundred thirty five (6,635) impairments that will require TMDLs (Figure 1).

To date, IDEM has completed a total of two thousand eight hundred sixty two (2,862) TMDLs, which have been approved by U.S. EPA for impairments to Indiana waters (Figure 2). Appendix 12 provides a TMDL key that can be used to associate the Category 4A impairments identified in Appendix 11 with their associated TMDLs, which are available on IDEM's website at: https://www.in.gov/idem/nps/2652.htm.

Table 1: Changes to the approved 2018 303(d) List.

Nature of Change	Total Number of Impairments	Total Number of Individual Waterbodies *	Stream Impairments	Individual Streams**	Stream Miles	Lake Impairments	Individual Lakes***	Lake Acres***
Impairments Removed from Category 5								
Impairments moved from Category 5 to Category 4A based on TMDL development*	58	58	58	58	261	0	0	0
Impairments removed from Category 5 based on new or revised assessments	15	13	15	13	87	0	0	0

IDEM's 2020 Consolidated Assessment and Listing Methodology (CALM)

[PLACEHOLDER]

APPENDIX 2

IDEM's Total Maximum Daily Load Program Priority Framework and Development Schedule

Indiana's 303(d) TMDL Program Priority Framework:

A Process for Implementing the National CWA 303(d) Long-Term Vision in Indiana

Watershed Planning and Restoration Section

Watershed Assessment and Planning Branch

Office of Water Quality

Indiana Department of Environmental Management

July 8, 2015

Background

The U.S. Environmental Protection Agency (U.S. EPA) has worked with State program managers to develop a new long-term Vision and Goals for the Clean Water Act (CWA) Section 303(d) Program. In Section 303(d) of the CWA, States are required to develop a list of impaired waters that do not meet State water quality standards, and establish priority rankings for waters on the list to develop Total Maximum Daily Loads (TMDLs). The purpose of this revision to the existing CWA Section 303(d) program is to assist with focusing State efforts to advance the effectiveness of the program in the future. Currently there are six tenants that form the groundwork of the new national long-term vision ("the Vision"):

Prioritization – For the 2016 integrated reporting cycle and beyond, States review, systematically prioritize, and report priority watersheds or waters for restoration and protection in their biennial integrated reports to facilitate State strategic planning for achieving water quality goals

Assessment – By 2020, States identify the extent of healthy and CWA Section 303(d) impaired waters in each State's priority watersheds or waters through site-specific assessments

Protection – For the 2016 reporting cycle and beyond, in addition to the traditional TMDL development priorities and schedules for waters in need of restoration, States identify protection planning priorities and approaches along with schedules to help prevent impairments in healthy waters, in a manner consistent with each State's systematic prioritization

Alternatives – By 2018, States use alternative approaches, in addition to TMDLs, that incorporate adaptive management and are tailored to specific circumstances where such approaches are better suited to implement priority watershed or water actions that achieve the water quality goals of each state, including identifying and reducing nonpoint sources of pollution

Engagement – By 2014, EPA and the States actively engage the public and other stakeholders to improve and protect water quality, as demonstrated by documented, inclusive, transparent, and consistent communication; requesting and sharing feedback on proposed approaches; and enhanced understanding of program objectives

Integration – By 2016, EPA and the States identify and coordinate implementation of key point source and nonpoint source control actions that foster effective integration across CWA programs, other statutory programs (e.g., CERCLA, RCRA, SDWA, CAA), and the water quality efforts of other Federal departments and agencies (e.g., Agriculture, Interior, Commerce) to achieve the water quality goals of each state (U.S. EPA 2013).

Indiana's Current Approach

The Clean Water Act (CWA) Section 303(d) Program in Indiana is administered by the Indiana Department of Environmental Management's (IDEM) Watershed Assessment and Planning Branch (WAPB), which also conducts surface water quality monitoring according to *the Indiana Surface Water Quality Strategy, 2011-2019*. While the WAPB uses data from several of its monitoring programs to determine water quality status, it primarily relies on a stratified, random sampling design to meet the CWA 305(b) requirement to "assess all waters." This approach is employed in a rotating basin cycle of nine years and will result in a comprehensive and updated data set for the entire state by 2019. Water quality data collected are assessed using applicable water quality criteria in the State's water quality standards and waterbodies are placed into one or more categories of the state's Consolidated List, available biennially in Indiana's Integrated Report.

While only a portion of the 63,600 miles of streams and rivers in Indiana have been monitored to date (leaving approximately 40,000 miles unassessed due to lack of data), approximately 20,000 miles of streams are listed as impaired under Category 5. Since the inception of the TMDL program in Indiana, 46 TMDL documents have been developed resulting in 1,225 individual TMDLs moving waterbodies from the 303(d) List of Impaired Waters Category 5 into Category 4a. Prior to the commencement of the Vision, IDEM's WAPB worked with U.S. EPA Region 5 every 303(d) listing cycle to determine the number of TMDLs to be developed. With the development of a national focus on showing results of water quality improvement, including the advent of several U.S. EPA focused success measures, Indiana has been moving toward a more holistic approach of TMDL development. In 2005, the TMDL and Nonpoint Source Program (NPS) were combined into the same section to realize efficiencies and better integrate the work of the two programs with the intended outcome that better outreach to watershed organizations would lead to implementation of the Reasonable Assurance section of the TMDL. In 2010, the TMDL and NPS program areas were part of an agency reorganization that resulted in a move to the Assessments Branch, which conducts surface water monitoring. This move allowed the integration of TMDL staff with other monitoring staff, yielding multiple benefits, including a more rigorous sampling design.

In 2012, it was determined that IDEM's involvement in monitoring for watershed management planning would coincide with monitoring done in preparation for a TMDL in the same watershed. The first TMDL project in which this occurred was the Deep River TMDL project, which was monitored in 2013. The TMDL report was approved by U.S. EPA in 2014 and the watershed group is currently incorporating information from the TMDL into a watershed management plan. This TMDL development and implementation strategy has been replicated in four additional watersheds to date, with plans to begin monitoring in yet another watershed in 2015. Key to the success of these projects is the availability of a watershed group in the TMDL watershed – without local support, implementation of the nonpoint source sections of the TMDL is likely to be compromised.

Moving forward with the Vision

At the June 2014 Watershed Planning and Restoration Section staff meeting, a program priority team committee was formed to begin work on Indiana's strategy to implement the national Vision for TMDL programs. The core members of the team were the NPS and TMDL program manager, the TMDL program team leader, the NPS senior watershed planner, and two watershed specialists and Section 319 grant project managers. Ad hoc members were involved as needed, including upper management, other program areas, and watershed monitoring staff. The team members began meeting regularly starting in August 2014, working toward the development of the new Indiana 303(d) TMDL Vision.

Indiana's TMDL Program Prioritization

Priority Watershed Selection Criteria

The focus of this process document is defining the method used to prioritize which waters will be the focus of TMDL planning and watershed restoration. The process for determining the TMDL priority watersheds will meet the following criteria (Figure 1). The first four criteria are required elements, while the remaining criteria are additional considerations when choosing between watersheds identified by working through the first four.

(1) First, the prioritization will begin by identifying those watersheds with impairments based upon Indiana's water quality standards and 303(d) list, since the CWA mandates that TMDLs be developed for impaired waterways. As the monitoring and assessment process continues to discover new impairments, the priority list will be updated from the most recent 303(d) List of Impaired Waters

(2) The second criterion ranks watersheds based on their current ability to meet Indiana's aquatic life designated use. Waters that have been designated with an impaired biotic community, but show a reasonable expectation for ecological recovery by means of a "good" habitat score (QHEI) and likely due to nutrient and/or sediment will be prioritized first for TMDL development. Indiana has a highly modified hydrologic landscape, and where current law and codes prohibit physical stream restoration, NPS improvements will most reasonably show biological community response where adequate habitat already exists. Within these watersheds identified for impaired aquatic life use, IDEM will also prioritize impairments of the recreational use due to exceedances of the *E. coli* criteria.

(3) The third criterion will identify those watersheds where neither an existing TMDL, nor a watershed planning effort has been completed. This criterion minimizes duplication of efforts where work is already progressing to improve water quality.

(4) The fourth criterion to be considered for TMDL development is the reasonable expectation that an entity to drive implementation exists in the watershed. Part of the TMDL process requires the State to provide "reasonable assurance" that the load reduction recommendations will be implemented. The presence of a dedicated entity (e.g. watershed group) motivated to implement a TMDL will reinforce the reasonable assurance of NPS reductions.

Additional Criteria Considered:

- Identify those surface waters that provide a source of water for public drinking water use. Citizens rely on adequate clean water for drinking, commercial and industrial uses for everyday life.

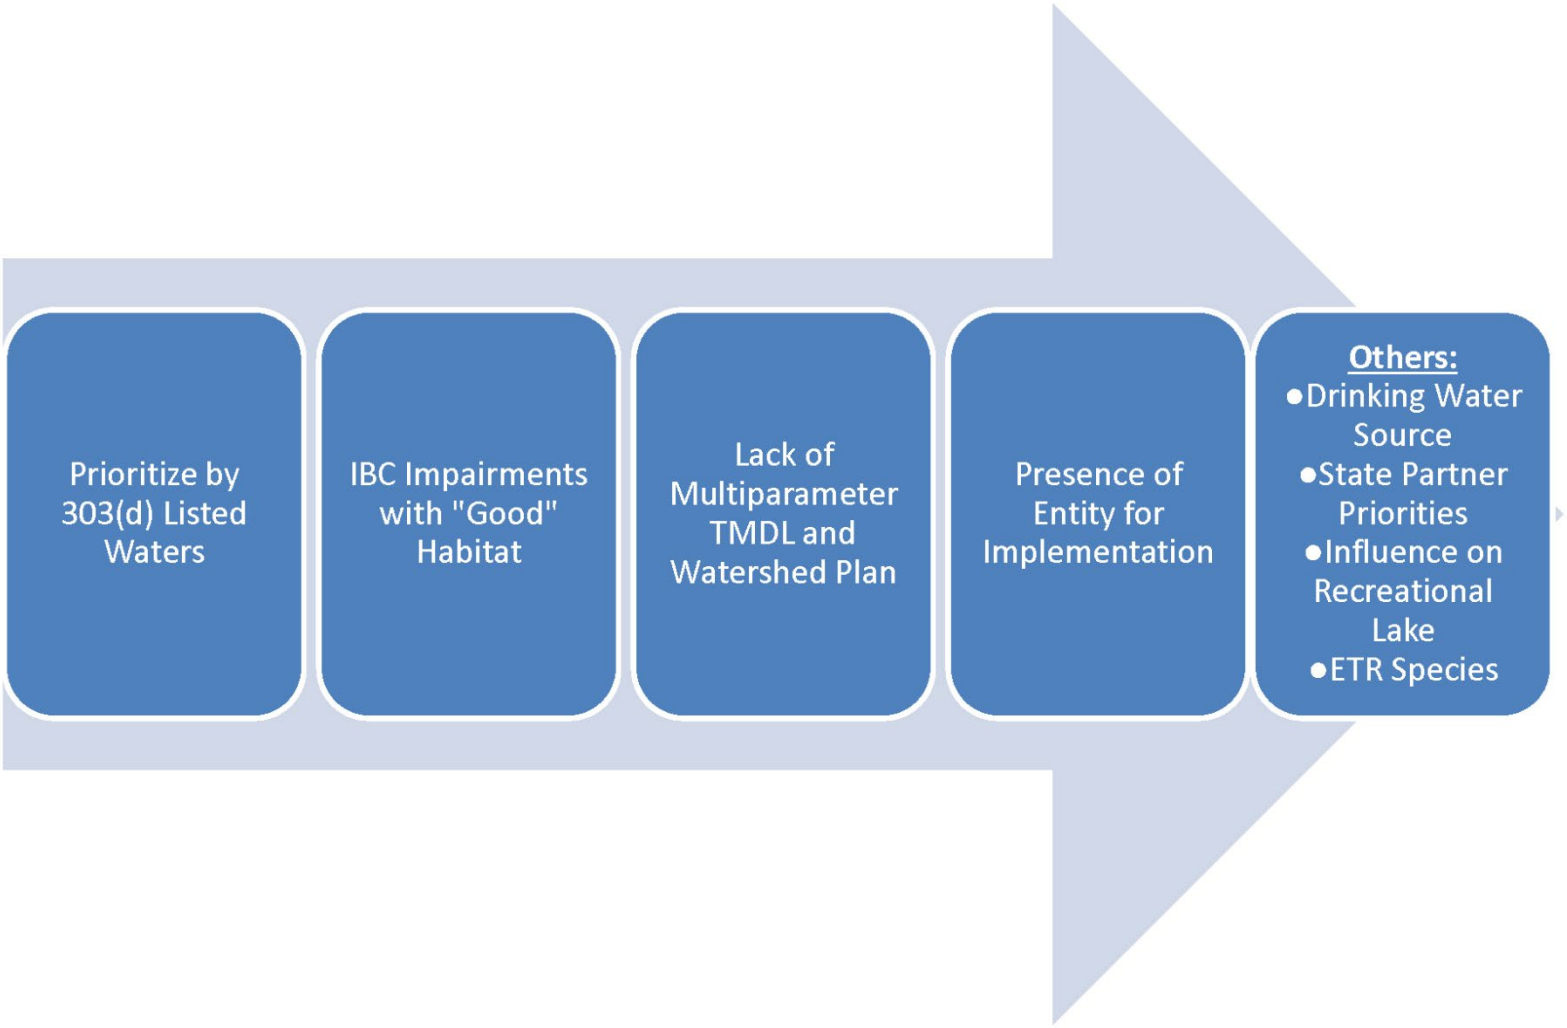
- Identify waters that are upstream of public-access lakes used for recreation. Nutrient-induced harmful algal blooms have been on the rise recently in Indiana lakes and reservoirs, threatening the use of these waterbodies for primary contact recreation.

- Identify waters that are home to endangered, threatened or rare species. Water quality pollution and loss of habitat have reduced the number of some species to critical numbers; restoration and protection of the remaining populations should be a priority.

- TMDL development based on priorities specific to the State of Indiana. This step is based on conversations about overlapping priorities with internal and external agency partners such as the Indiana Conservation Partnership (ICP)[1], as well as consideration of time sensitive or current relevant high profile issues (e.g. Western Lake Erie Basin eutrophication).

[1] The ICP is comprised of eight Indiana agencies and organizations who share a common goal of promoting conservation. Members include the Indiana Association of Soil and Water Conservation Districts, Indiana Department of Environmental Management, Indiana Department of Natural Resources, Indiana State Department of Agriculture, Purdue Cooperative Extension Service, Indiana State Soil Conservation Board, USDA Farm Service Agency and the USDA Natural Resources Conservation Service.

Figure 1 Priority watershed selection process



Priority List 2015-2022

The key to IDEM's current TMDL implementation strategy is the availability of a local stakeholder group ready, willing, and able to implement the TMDL. Due to the nature and dynamics of such groups, the availability of a cohesive group of stakeholders to lead a watershed planning and/or implementation effort subsequent to development of a TMDL is often unknown on a long-term basis. Therefore, though IDEM's process for choosing TMDL watersheds remains consistent, its list of priority watersheds is in a necessary state of flux. IDEM also finds itself with resource constraints that limit its TMDL development commitment to providing TMDLs for one 10-digit watershed per fiscal year. These TMDLs will be restricted to streams and rivers with *E.coli* impairment, and impaired biotic communities caused by one or more of the following conditions:

- Dissolved oxygen
- Algae
- Total Suspended Solids
- Phosphorus

IDEM has agreed with U.S. EPA to develop three TMDLs that are already in progress using the prior selection methods, and one TMDL using the new Vision prioritization method, each focused on 10-digit watershed scales. These four TMDLs are high priority for completion in the short term, as watershed groups are poised to develop plans and drive implementation in the area. These four TMDLs and their completion years are as follows:

- Southern Whitewater River (2015)
- Mississinewa River (2016)
- South Fork Blue River (2016)
- Salt Creek (2017)

The 10-digit watersheds listed in Appendix A may meet IDEM's criteria for TMDL development over the next six years. Each watershed has been selected using the four priority watershed selection criteria (p.3-4). They have been further prioritized for potential short-term and long-term selection using the additional watershed selection criteria (p.4), categorizing them as either high (green), medium (coral), or low (blue). Beginning in 2016, IDEM will select one 10-digit watershed per year for TMDL development and implementation after 2017, as agreed upon with U.S. EPA.

TMDL Alternatives and Protection Strategies

IDEM does not expect to explicitly prioritize TMDL alternatives or protection strategies at this time, but will explore the use of TMDL alternatives and protection strategies as the situation arises, and work with USEPA to collaborate on mutually acceptable plans.

APPENDIX K:

IDEM'S RESPONSES TO U.S. EPA COMMENTS ON INDIANA'S DRAFT 2020 303(D) LIST AND CONSOLIDATED ASSESSMENT AND LISTING METHODOLOGY (CALM)

1. The attached excel file (**IN2020IR-PN-Draft-Data_EPA-Comments.xlsx**) includes tabs with questions/comments (Refer to the **EPA Comment** column in the excel file) on a series of specific AU_IDs and/or parameters based on information provided in ATTAINS. Please provide clarifications or explanations regarding these specific AU_IDs and/or parameters.

   IDEM Response: *Appendix K2 of IDEM's 2020 Integrated Report submittal is a spreadsheet file which contains IDEM's responses to U.S. EPA comments regarding the specific AUIDs and parameters in question.*

2. Below are some comments on Indiana's 2020 Consolidated Assessment and Listing Methodology (CALM) (Appendix 1).

   a. Page 13, bullet point on the page identifies Cyanobacteria monitoring of 10-12 lakes. Are these in the same rotating basins as the streams? I assume they are not the same lakes each year/listing cycle. This should be clarified.

      IDEM Response: *In contrast to IDEM's rotating basin monitoring strategy for streams, IDEM's cyanobacteria monitoring for lakes is targeted in nature and focuses on swimming areas of selected lakes at some state parks and state recreation areas. This has been clarified in the CALM.*

   b. Page 16, first paragraph discusses the CLP. Does the Indiana University also monitor for cyanobacteria?

      IDEM Response: *The Indiana Clean Lakes Program does not routinely monitor for cyanobacteria. However, IDEM's Nonpoint Source Program provided funding for a monitoring project which resulted in the 2005 report entitled, Distribution and Abundance of Cylindrospermopsis raciborskii in Indiana Lakes and Reservoirs.*

   c. Page 67, foot note 6 (used in page 20) and foot note 8 (used in Table 3) included the following: "Dissolved oxygen and temperature results are also evaluated for exceedance(s) of the applicable criteria. However, these results are not used to make impairment decisions because the data are not considered representative of conditions throughout each pool or over the entire assessment period." Even though ORSANCO does not list for DO, does IDEM use this data to make a listing determination on segments of the Ohio River? This is readily available data and IDEM has a listing methodology for DO in other parts of the state. Note lack of a listing method is not a rational for not using data. This issue also applies to temperature readings on the Ohio River.

      IDEM Response: *As Indiana is a member state of the Compact, IDEM actively participates in ORSANCO's decision-making processes regarding its monitoring strategy and biennial water quality assessments. Thus, those assessments that IDEM incorporates into its 303(d) list and the data upon which they are based have been reviewed by IDEM and are considered to be appropriate for use in the development of Indiana's 303(d) list.*

   d. Page 23, Table 4. For Dioxin, the fully support and not support are identical. Should fully supporting read "Less than or equal to"?

***IDEM Response**: This is a typographical error that has been corrected in the CALM submitted with IDEM's 2020 Integrated Report (Appendix G).*

3. EPA determined on its final action on IDEM's 2010 303(d) List that it was appropriate to use total metals data and derived criteria for making WQS attainment determinations and 303(d) listing decisions for Indiana waters. Pending further discussion with the State, EPA took no action on Indiana's 2012, 2014, 2016, and 2018 Section 303(d) lists with respect to the metals issue. EPA is continuing to consider this issue with regards to the 2020 List.

   ***IDEM Response**: IDEM maintains that it has already provided U.S. EPA good cause for the waters delisted and those not previously listed that U.S. EPA wishes to add to Indiana's 303(d) list. IDEM remains open to discussion with EPA as they continue to consider this issue.*

INW08F8_T1009					Full Body Contact	Fully Supporting	2			AU_ID INW08F8_T1009 is included under TMDL Action ID IN-2020-001 as addressed by Lower East Fork White River Watershed TMDL E. coli TMDLs, but IDEM currently has not associated TMDL action. AU_ID/Use is currently in Cat2. This is a recent approval so this should affect the AU ID assessment status, and E. COLI parameter should be added and associated with TMDL action and appear under Cat 4A. Please clarify/ make needed corrections.	*IDEM correctly assessed Full Body Contact as impaired for ESCHERICHIA COLI (E. COLI) and associated this parameter with TMDL Action ID IN-2020-0001 in ATTAINS after publication of the draft 303(d) list. No additional changes are needed.*	*No Changes*
INW08F8_T1010					Full Body Contact	Fully Supporting	2			AU_ID INW08F8_T1010 is included under TMDL Action ID IN-2020-001 as addressed by Lower East Fork White River Watershed TMDL E. coli TMDLs, but IDEM currently has not associated TMDL action. AU_ID/Use is currently in Cat2. This is a recent approval so this should affect the AU ID assessment status, and E. INB07P1003_00	INB07P1003_00	KOKOMO RESERVOIR NO. 2	CHLOROPHYLL-A	CHLOROPHYLL-A	REMOVED		5	NOT_SPECIFIED	Not specified	According to records, this AU/parameter appears still listed Cat5 in 2018, eventhough it was removed in ATTAINS, and no delisting rational was provided. Please provide a specific delisting reason.	*Original assessment indicated that pesticides were needed to control algal growth for continued use as a public water supply source water. CHLOROPHYLL-A reflects an impairment for ALGAE that was carried over with IDEM's ADB data into ATTAINS incorrectly. CHLOROPHYLL-A was subsequently changed in ATTAINS to an ALGAE impairment. There was also a Taste & Odor impairment associated with the original assessment, which was carried over into ATTAINS as a TASTE impairment. This waterbody is currently listed for both ALGAE and TASTE. IDEM's current assessment methodology does not use any of these parameters as indicators of impairment. However, because the use of pesticides to control algae could be considered a measure that goes above and beyond conventional treatment, ALGAE and TASTE will remain in Category 5 until such time as there is available data to determine support of the public water supply use per current methodology.*	*No Change -- ATTAINS-only corrections*
ING03P1012_00	ING03P1012_00	MIDDLE FORK RESERVOIR	CHLOROPHYLL-A	CHLOROPHYLL-A	REMOVED		5	NOT_SPECIFIED	Not specified	According to records, this AU/parameter appears still listed Cat5 in 2018, eventhough it was removed in ATTAINS, and no delisting rational was provided. Please provide a specific delisting reason.	*20200603/JMA: Original assessment indicated this waterbody was impaired for Algae and Taste & Odor issues. This assessment was likely based on pesticide permits requested to control algal growth. CHLOROPHYLL-A reflects an impairment for ALGAE that was carried over with IDEM's ADB data into ATTAINS incorrectly. CHLOROPHYLL-A was subsequently changed in ATTAINS to an ALGAE impairment, and the Taste & Odor impairment associated with the original assessment was carried over into ATTAINS as a TASTE impairment. This waterbody is currently listed for both ALGAE and TASTE. IDEM's current assessment methodology does not use any of these parameters as indicators of impairment. However, ALGAE and TASTE will remain in Category 5 until such time as there the data necessary to determine support of the public water supply use per current methodology becomes available.*	*No Change -- ATTAINS-only corrections*
