2024 WATER QUALITY REPORT

**WASHINGTON
TOWNSHIP WATER
AUTHORITY**
www.wtwc.org

Public Water System ID # IN 5253009

In order to ensure that tap water is safe to drink, USEPA and the Indiana Department of Environmental Management prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. This publication describes those guidelines for the Washington Township Water's drinking water. Food and Drug Administration regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and their potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons, such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are

available from the Safe Drinking Water Hotline (800-426-4791).

Service line spotting and identification

As part of a new regulation from the EPA all public water systems must compile a database of the service lines in their system. The purpose of this work is to identify the materials that the water company's and it's customers service lines are made of. In doing so, if any lead pipes are found they should be replace. Washington Township Water Authority has never found any lead lines in our system, but in order to comply with the new regulation and to be sure our members receive the safest water possible we have begun spotting service lines that were installed before 1987, the year lead lines were no longer allowed to be used. Collecting this information will allow us to build the database which will be available online in the near future.

Important Information about Lead in Water:

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with lead service lines and home plumbing. We cannot control the variety of materials used in plumbing components.

When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking and cooking.

If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, test methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at www.epa.gov/safewater/lead.

Your Drinking Water Source

The source of Washington Township Water's drinking water is surface water from Monroe Reservoir, located nine miles southeast of Bloomington. The City of Bloomington has received a copy of the Indiana-Monroe Reservoir Source Water Assessment. Federal guidelines require the State of Indiana to issue Source Water Assessments in order to identify significant or possible sources of contamination. Information concerning Monroe Reservoir's Source Water Assessment is available by contacting the City of Bloomington's Water Quality Office. CBU participates in EPA's Unregulated Contaminant Monitoring Rule. Contact the Water Quality Office(812-349-3655) for more information or copies of results related to this testing program.

The sources of drinking water (both tap and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally occurring or result from urban stormwater runoff, industrial or domestic waste water discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, include synthetic and volatile organic chemicals, that are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.

Substance	Highest Level Allowed (EPA's MCL*)	Highest Level Detected	Violation	Ideal Goals (EPA's MCLG's*)	Sources of Contamination
Microbiological Contaminants					
Total Coliform Bacteria	5 percent	1.1 percent	No	0	Naturally present in the environment
Total Organic Carbon (TOC)	minimum 35% removal	38.3% removal average ¹	No ²	None	Naturally present in the environment
Turbidity	Treatment Technique (TT) [*]	0.10 turbidity units ³	No	None	Soil runoff
Radioactive Contaminants					
Beta/photon emitters	4 mreemyr [*]	3.3 mreemyr ⁴	No	0	Decay of natural and man-made deposits
Gross alpha excluding radon and uranium	15 pCi/L [*]	0.1 pCi/L ⁴	No	0	Erosion of natural deposits
Combined Radium 226/228	5 pCi/L	0.37 pCi/L ⁴	No	0	Erosion of natural deposits
Inorganic Contaminants					
Barium	2 ppm [*]	0.017 ppm	No	2 ppm	Erosion of natural deposits
Copper	TT: Action Level [*] = 1.3 ppm	(.040).035 ppm (90th Percentile) ⁵	No	1.3 ppm	Corrosion of household plumbing systems; erosion of natural deposits
Chloramines (as Chlorine)	4.0 ppm (MRDL) [*]	3.2 ppm ⁶	No	4 ppm (MRDLG) [*]	Water additive to control microbes
Fluoride	4 ppm	0.050 ppm ⁷	No	4 ppm	Water additive which promotes strong teeth
Lead	TT: Action Level = 15 ppb [*]	(1.0)3.3 ppb (90th Percentile) ⁵	No	0	Corrosion of household plumbing systems; erosion of natural deposits
Organic Contaminants					
Total Trihalomethanes (TTHM)	80 ppb	(42)48.0 ppb average ⁸	No	0	By-product of drinking water disinfection
Haloacetic Acids (HAA5)	60 ppb	(42)35.1 ppb average ⁹	No	0	By-product of drinking water disinfection
2,4-D	70 ppb	0.2 ppb ⁴	No	70 ppb	Runoff from herbicide used on row crops

LISTED ABOVE are 14 contaminants detected in Bloomington's drinking water during 2023. All are within allowable levels. Not listed are the over 70 primary contaminants for which we tested that were not detected.

*DEFINITIONS:

90th Percentile - Ninety percent of samples had lower values than the value indicated.

Action Level - The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Average - Regulatory compliance with some MCLs are based on running annual average of samples.

Locational Running Annual Average (LRAA) - Average of the four most recent quarterly samples collected for reporting purposes, for each sample site.

Maximum Contaminant Level (MCL) - The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The level of contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) - The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contamination.

mremyr - millirem per year. This is a measure of effective radiation dose per year.

pCi/L - Picouries per liter is a measure of radioactivity in water. A picocurie is 10-12 curies and is the quantity of radioactive material producing 2.22 nuclear transformations per minute.

ppm - parts per million. Equivalent to milligrams per liter (mg/l) or one ounce in 7,350 gallons of water.

ppb - parts per billion. Equivalent to micrograms per liter (ug/l) or one ounce in 7,350,000 gallons of water.

Total Organic Carbon (TOC) - a measurement of natural and man-made organic material in the water. TOC reacts with disinfectants to form disinfection by-products.

Treatment Technique (TT)- A required process intended to reduce the level of a contaminant in drinking water.

ADDITIONAL INFORMATION:

1 Total Organic Carbon (TOC) removal percentages ranged from 31.0% to 47.9%.

2 CBU was cited for failure to sample and/or report results for April 2023, under 321 IAC 8-2.5-20, when samples were collected but lost in transit to the testing lab.

3 Turbidity levels ranged from 0.04 to 0.10 with an average of 0.054 turbidity units. The lowest level of compliance on a monthly basis was 100%.

4 Data listed are from 2021 and are the most recent testing done in accordance with regulations.

5 No sites exceeded the Action Level for Copper and one site exceeded the Action Level for Lead. Data listed are from 2022 and are the most recent testing done, in accordance with regulations.

6 Chloramine levels ranged from 0.00 to 3.2 ppm, with an average of 2.36 ppm

7 Fluoride levels ranged from 0.00 to 0.73mg/l, with an average of 0.31 mg/l

8 Average listed is the greatest LRAA for any sample site during 2023. Total trihalomethane (TTHM) levels ranged from **(35 to 56.1)**26.0 to 66.0 ppb. Some people who drink water containing TTHM in excess of the MCL over many years could experience problems with their liver, kidneys, or central nervous systems, and may have increased risk of getting cancer.

9 Average listed is the greatest LRAA for any sample site during 2023. Haloacetic acids (HAA5) levels ranged from **(15.8 to 59.7)** 20.8 to 51.6 ppb. Some people who drink water containing haloacetic acids in excess of the MCL over many years may have an increased risk of getting cancer.
