Executive Summary

A suspected release from the underground storage tank (UST) system was reported to the Indiana Department of Environmental Management (IDEM) at Circle K #42 on February 12, 2024 by American Environmental Corporation (American Environmental) personnel, Mr. James Madding. The kerosene STP was observed leaking into the soil and there is no containment for the kerosene UST.

The IDEM assigned the facility Leaking Underground Storage Tank (LUST) Incident Number 202402503.

IDEM issued a Release Investigation and Confirmation Steps request letter dated February 12, 2024. A site check investigation revealed detectable volatile organic compound (VOC) concentrations in the soil and groundwater samples. In their letter dated April 26, 2024 the IDEM requested an Initial Site Characterization (ISC).

1.0 SITE DESCRIPTION

1.1 Regional Location

The site is located in the USGS Speed Quadrangle Map in Township 17 North, Range 4 East, Section 12. The regional topography is relatively flat with a slight slope to the south and the overall regional slope to the southwest. A Site Vicinity Map is provided as **Figure 1**.

1.2 Site Location

The site is located in a mixed residential and commercial area on the south side of Sellersburg, Indiana. The site is bordered to the north by S. Indiana Avenue and Jim O'Neal Ford, to the south by Jamal Auto Sales and a former carwash, to the east by ES Indiana Avenue and Dixon Racing Supply, and to the west by Popp Avenue, Marie's Place Barber and Beauty Salon, and Popp Music Academy. A Site Map is provided as **Figure 2**.

1.3 Regional Geologic and Hydrologic Information

1.3.1 Soils

The USDA Soil Survey of Clark County, Indiana documents that the site soils are classified as Jennings Series. The Jennings Series consists of deep, well-drained soils on uplands. These nearly level and gently sloping soils are on narrow ridges and hillsides. They formed in thin loess over loam or clay loam glacial till that is underlain by material weathered from black shale bedrock. Permeable is slow and surface runoff is slow to medium.

1.3.2 Bedrock Geology

According to the *Hydrogeologic Atlas of Aquifers in Indiana*, the project site is located in the Ohio River Basin. The Ohio River Basin is comprised of seven physiographic regions. The Scottsburg Lowland is found in the central portion of the of the basin, is a nearly flat to gently undulating till plain.

The bedrock beneath the site is the Devonian and Mississippian Shale composed of the New Albany Shale. According to the Hydrogeologic Atlas of Aquifers in Indiana, the thickness of unconsolidated material is less than 50 feet.

1.3.3 Aquifers

The site is located within the Ohio River Basin, located in southern Indiana. Five aquifer types are encountered within the Ohio River Basin and include: (1) buried sand and gravel, (2) carbonate bedrock, (3) upper weathered- bedrock, (4) complexly interbedded sandstone, shale, limestone, and coal, and (5) sandstone.

The site is underlain by carbonate bedrock aquifer. The site is not within a wellhead protection area.

1.3.4 Low and High-Capacity Water Well Information

Two low-capacity water wells were identified within a 1-mile radius of the site. The nearest low-capacity water well (Reference Number 195660) is located on-site and is used for the car wash. The low-capacity water wells are illustrated on **Figure 3**.

One high-capacity water well is identified within a 2-mile radius of the site. The closest significant withdraw well is owned by Lehigh Cement Company LLC, (Reference Number 00536). Water well records were not available for these high-capacity wells. High capacity and significant withdraw wells are illustrated on **Figure 4**.

The available low-capacity water well records are provided as **Appendix A**.

1.4 Site-Specific Geologic and Hydrologic Information

The unconsolidated native material encountered during subsurface investigations generally consists of silty clay and shale bedrock to the depths explored, 13 ft.

A Cross-Section Location Map and Cross-Sections A to A' and B to B' are provided as **Figures 5** through **7**. The soil boring logs/well construction diagrams are included in **Appendix B**.

2.0 SITE HISTORY

2.1 Land Use History

The property has been occupied by a gasoline station since at least 1974. Johnson Oil Company operated the station in the past. Mac's Convenience Stores LLC purchased the property in 2006 and is the current owner / operator.

The one 10,000-gallon and 6,000-gallon gasoline USTs were installed in 1983 and the one 4,000-gallon diesel UST and one 4,000-gallon kerosene UST were installed in 1974.

The most recent tank tightness testing results are provided in **Appendix C**.

The facility, responsible party, and operator information are provided in **Table 1** and the site UST information is summarized in **Table 2**.

2.2 Overview of Previous Environmental Investigations

Soil Exploration Services and American Environmental performed environmental activities in the past at the Circle K #42 facility (formerly Bigfoot #42) associated with IDEM incident numbers 9504082 and 200105514. IDEM issued a No Further Action status for the 1995 and 2001 incidents on December 29, 2003.

2.3 Reason for Performing ISC Investigation

A suspected release from the UST system was reported to the IDEM at Circle K #42 on February 12, 2024 by American Environmental personnel, Mr. James Madding. The kerosene STP was observed leaking into the soil and there is no containment for the kerosene UST.

The IDEM assigned the facility LUST Incident Number 202402503.

In their letter dated April 26, 2024 the IDEM requested an initial site characterization to gather information regarding the release and surrounding area, including, but not limited to, collection of soil and groundwater data, evaluation of potential pathways for migration, and evaluation of

receptors. Specific details regarding the release incident are provided below and summarized in **Table 3**.

3.0 SITE CONDITIONS

3.1 Determination of Present and Future Land Use

The site has been utilized as a petroleum fuel marketing facility since at least 1974. The site is bordered to the north by S. Indiana Avenue and Jim O'Neal Ford, to the south by Jamal Auto Sales and a former carwash, to the east by ES. Indiana Avenue and Dixon Racing Supply, and to the west by Popp Avenue, Marie's Place Barber and Beauty Salon, and Popp Music Academy.

3.2 Assessment of Potentially Susceptible Areas

Geologic and ecologic susceptible areas were not identified onsite or in the immediate vicinity of the site. A retention pond is located approximately 1,400 feet to the south of the site. Camp Run is located approximately 1,500 feet to the south and flows from east to west.

The site is not located within a Wellhead Protection Area. A copy of the Wellhead Protection Area Proximity Determination is provided in **Appendix D**.

3.3 Potential Exposure Pathways

3.3.1 Inhalation Exposure Pathway

Possible routes for exposure are indoor and outdoor inhalation of vapors released from the impacted soil and/or groundwater. The chemicals of concern (COCs) have been detected in the subsurface soil and groundwater; however, the depth of the impacts and asphalt and concrete surface of the site inhibit the transmission of dangerous concentrations of hydrocarbon vapors from the soil to the atmosphere.

The extent of the groundwater impacts has not been fully defined to the northeast and northwest. However, based on the detected concentrations and location, this exposure pathway appears incomplete.

3.3.2 Vapor Intrusion Evaluation

The following is an evaluation of potential vapor intrusion at onsite and surrounding structures.

Further investigation of vapor intrusion is appropriate in situations where:

• Building has less than 15 feet of vertical or horizontal separation from non-aqueous phase liquid (NAPL),
• Building has less than six feet of vertical or horizontal separation from groundwater with dissolved benzene above 50 ug/L,
• Building has less than six feet of vertical or horizontal separation from soil containing volatile petroleum chemicals, or
• Building occupants near the petroleum source area complain of chemical odors.

Based on the above criteria, none of which applies, the onsite and surrounding properties "screen out" for further consideration of vapor intrusion at this time, however vapor intrusion will continue to be evaluated.

3.3.3 Ingestion Exposure Pathway

The impacted soil and groundwater are confined to the subsurface and the surface cover at the site is asphalt/concrete. The impacted shallow water-bearing unit is not utilized as a potable water source within the immediate vicinity of the site and the City of Sellersburg supplies the area with municipal water. Based on the detected concentrations and location, this exposure pathway appears incomplete.

3.3.4 Dermal Absorption Exposure Pathway

The impacted soil and groundwater are confined to the subsurface and the surface cover at the site is asphalt/concrete. The impacted shallow water-bearing unit is not utilized as a potable water source within the immediate vicinity of the site and the City of Sellersburg supplies the area with municipal water. The extent of the groundwater impacts has not been fully defined to the north and east. However, based on the detected concentrations and location, this exposure pathway appears incomplete.

3.4 Chemicals of Concern

The chemicals of concern (COCs) for the site include VOCs and polynuclear aromatic hydrocarbons (PAHs) for soil and groundwater. The COCs are further summarized in **Table 4**.

4.0 SITE INVESTIGATION

4.1 Sampling Objectives and Rationale

The initial monitoring well locations were selected based on the proximity to potential source areas. The sampling objectives are to delineate the adsorbed and dissolved petroleum hydrocarbon plumes to the R2 screening levels.

4.2 Soil Sampling Event

Four soil borings were advanced, and four monitoring wells were installed (MW-1 through MW-4) on June 3, 2024. A Site Map is provided as **Figure 2**. Monitoring well locations MW-3 and MW-4 were advanced adjacent to previous borings B-4, and B-5, respectively, during the Site Check investigation where they were advanced to a depths of 10 to 13 feet. No soil samples were collected from these two locations.

Soil samples were collected continuously from 9 to 10 feet throughout the remaining soil borings via a stainless steel macrosampler lined with an acetate sleeve. The soil column was visually inspected and classified in the field by American Environmental personnel according to the Unified Soil Classification System. The soil samples were collected while wearing dedicated, disposable nitrile gloves utilizing the USEPA 5035A sample collection method and placed into 40mL vials with distilled water or methanol. A portion of each soil sample was also placed into four-ounce glass jars with Teflon lined lids, labeled, placed on ice, and delivered to Pace Analytical Services (Pace) located in Indianapolis, Indiana under chain of custody controls. A separate portion of each sample was placed in a sealable plastic bag and screened in the field with a photoionization detector. Soil boring logs are provided in **Appendix B.**

A total of two soil samples from monitoring well locations MW-1 and MW-2 were collected and submitted for laboratory analysis of adsorbed VOCs using USEPA Method 8260 and PAHs using USEPA Method 8270.

4.3 Soil Analytical Results

The current laboratory analytical report indicated that adsorbed VOC and PAH concentrations were nondetectable and below the IDEM R2 excavation published levels (XSPLs) at the two monitoring well locations.

The current and past soil laboratory analytical results are summarized in **Tables 5** and **6** and are illustrated on **Figure 8**. The complete laboratory analytical report is included in **Appendix E**.

4.4 Groundwater Sampling Event

Upon completion of the soil boring activities, three monitoring wells, MW-1 through MW-4, were installed by American Drilling Services. A two-inch diameter Schedule 40 PVC monitoring well was installed in the boreholes at depths of 8.36 ft. to 12.87 ft. bgs. Ten feet of .010 factory slotted screen was installed to straddle the water table being monitored. A sand pack was placed approximately two feet above the top of each screen, and a bentonite slurry seal was placed above the sand pack. The remaining annular space was filled with a bentonite grout to the land surface. Each well was developed to ensure a good hydraulic connection between the saturated zone and the monitoring well. A locking cap and manhole cover set in a 2-ft. by 2-ft.

concrete pad was installed over each well to protect the wellhead and inhibit tampering. Monitoring well construction diagrams using the same scale are provided in **Appendix B**.

American Environmental personnel obtained groundwater samples from monitoring wells MW-1 through MW-4 after purging three well volumes from the monitoring wells. A representative sample was collected from each monitoring well using dedicated bailers and sample gloves. The sample was placed in 40-ml glass vials with a Teflon septa lids, labeled, placed on ice and transported to Pace under chain of custody controls.

The collected groundwater sample was submitted for laboratory analysis of dissolved VOCs and PAHs.

Monitoring wells MW-1 through MW-4 were surveyed into a common benchmark and the elevation data was used to determine the groundwater flow direction at the site. Prior to groundwater sampling, the static water level was measured using an electronic water level indicator to the nearest 0.01-ft at monitoring well locations MW-1 through MW-3. The depth to groundwater ranged from 2.17 feet below the top of casing at MW-2 to 2.86 feet below the top of casing at MW-3. Based on these measurements, the inferred groundwater flow direction is to the northeast. The groundwater elevation measurements are summarized in **Table 7** and a Groundwater Flow Map is included as **Figure 9**.

4.5 Groundwater Analytical Results

The current laboratory analytical report indicated that dissolved benzene was detected above the IDEM groundwater published level (GWPL) of 5 parts per billion (ppb) at monitoring well locations MW-1 and MW-3 at a concentrations of 13 ppb and 804 ppb, respectively.

Naphthalene was detected above the IDEM GWPL of 1 ppb at monitoring well locations MW-1 and MW-3 at concentrations of 2.7 ppb and 21.6 ppb, respectively.

Monitoring well locations MW-2 and MW-4 revealed nondetectable VOC and PAH concentrations.

The groundwater laboratory analytical results are summarized in **Tables 8** and **9** and are illustrated on **Figure 10**. The complete laboratory analytical report is included in **Appendix E**.

4.6 Vapor Intrusion Evaluation

The site is an active gasoline station. American Environmental does not recommend a vapor intrusion investigation at this time, however vapor intrusion will continue to be evaluated.

5.0 CONCLUSIONS AND RECOMMENDATIONS

5.1 Conclusions

5.1.1 Soil

The past and current laboratory analytical reports indicated adsorbed VOC and PAH concentrations are nondetectable and below the IDEM XSPLs at all boring and monitoring well locations.

5.1.2 Groundwater

The laboratory analytical results confirm dissolved VOC and PAH impacts are present at MW-1 and MW-3 at concentrations exceeding the IDEM GWPLs. The extent of the groundwater impacts are not delineated to the north, northwest, and northeast.

5.1.3 Vapor Intrusion

The site is an active gasoline station. American Environmental does not recommend a vapor intrusion investigation at this time, however vapor intrusion will continue to be evaluated.

5.1.4 Free Product

Free product has not been observed in any of the boring or monitoring well locations.

5.2 Recommendations

American Environmental recommends that quarterly groundwater monitoring be initiated for MW-1 through MW-4. Groundwater samples will be collected for VOCs and PAHs. The benzene and naphthalene concentrations at MW-3 should be evaluated after two quarterly sampling events to determine if a further site investigation is warranted.

QUALIFIERS

Project: CK #42
Pace Project No.: 50374807

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

1d	Neither matrix spike nor matrix precision data could be provided for this analytical batch due to insufficient sample volume.
ED	Due to the extract's physical characteristics, the analysis was performed at dilution.
L1	Analyte recovery in the laboratory control sample (LCS) was above QC limits. Results for this analyte in associated samples may be biased high.
N2	The lab does not hold NELAC/TNI accreditation for this parameter but other accreditations/certifications may apply. A complete list of accreditations/certifications is available upon request.
R1	RPD value was outside control limits.
S5	Surrogate recovery outside control limits due to matrix interferences (not confirmed by re-analysis).

QUALIFIERS

Project: CK 42
Pace Project No.: 50375315

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

L1	Analyte recovery in the laboratory control sample (LCS) was above QC limits. Results for this analyte in associated samples may be biased high.
M0	Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
R1	RPD value was outside control limits.
