Mr. Weinzapfel,

Please see the Spring 2024 Tree Report for the Twin Bridges RDF attached to this email.

Please reach out with any questions that you may have.

Regards,

**Thomas Smallwood, Ph.D.**

Subject: Semi-annual Tree Monitoring Report  
Twin Bridges Recycling & Disposal Facility  
Danville, Hendricks County, Indiana  
IDEM Solid Waste Facility Permit FP 32-02  
DHE Project WMI.001

Dear Justin:

### **1.0 PURPOSE**

The purpose of this report is to present the data collected during the Spring 2024 monitoring event and describe the status of the vegetation and hydrology within the tree planting plots at Twin Bridges Landfill and corrective actions taken. The following sections discuss the monitoring program, results, and recommendations for the tree planting area.

### **2.0 MONITORING PROGRAM**

The landfill is responsible for properly installing and maintaining the tree planting project in compliance with the plan entitled “Minor Permit Modification Request to Plant Selected Trees in Vegetative Soil Layer of Final Cover” dated August 4, 2004. The solid waste permit was modified to allow for the planting of woody vegetation on a permitted solid waste facility as a pilot project. The plan consists of the planting of approximately 170 trees at a rate of 400 trees per acre density, with 15 lbs. of herbaceous under story mix broadcast or drilled into the soil over the entire planting area. Prior to planting, weeds and existing vegetation would be controlled with an appropriate herbicide and fertilizer would be added to aid the trees which would be growing in poor soils.

The monitoring event consists of vegetation and soil assessments to determine the development of the tree planting effort according to performance standards set in the

approved permit. Vegetation monitoring will be conducted twice per year during the growing season in Spring and Fall, over a minimum five year period. In addition to monitoring the vegetation during the monitoring events, wildlife usage will be noted and recommendations made for improvement. If deficiencies are noted, corrective actions will be recommended to ensure compliance with the permit. The vegetation monitoring is the main evaluation of the status of the project. The locations of the monitoring plots are presented in Figure 1.

### **3.0 VEGETATION MONITORING**

Woody stem counts were counted within each 50' X 50' plot to assess survival of the tree species. Sampling of the herbaceous understory planting consisted of monitoring percent cover of native understory in each plot to assess the percent cover of the herbaceous species. The Spring, 2024 monitoring event was conducted on May 29, 2024. A listing of the species survival is discussed below.

The eight plots were planted in Spring, 2009 with an appropriate understory of seed oats and native grasses. Trees were planted on approximately five-foot centers.

To address the previously high mortality rate of the trees, WMI instituted corrective actions on the plots. On October 3, 2013, 19 3-gallon containerized trees were planted in Plot #8, which had been cleared due to a previous erosion problem and left barren. Prior to the tree planting, the plot was sprayed with appropriate herbicide, seeded with native understory grasses and fenced off to deter deer predation. After the planting, fertilizer was added to the trees and soap was hung from the branches as an experiment for additional deer deterrent. Trees came in 3-gallon containers with their own soil. Other backfilled soil was the typical fill material existing on the landfill that all other trees were installed in. The exact species of trees include:

<b>3-Gallon Containerized Trees Planted in Plot 8 in October, 2013</b>	
Gymnocladus dioicus	Kentucky Coffee Tree
Cornus amomum	Silky Dogwood
Diospyrus virginiana	Persimmon
Betula nigra (2)	River Birch
Platanus occidentalis	Sycamore
Quercus macrocarpa	Bur Oak
Quercus imbricaria	Shingle Oak
Quercus rubra	Red Oak
Quercus muehlenbergii	Chinquapin Oak

<i>Quercus lyrata</i>	Overcup Oak
<i>Quercus velutina</i>	Black Oak
<i>Quercus shumardii</i>	Shumard Oak
<i>Liriodendron tulipifera</i>	Tulip Poplar
<i>Viburnum lentago</i>	Nannyberry
<i>Liquidambar styraciflua</i>	Sweetgum
<i>Aesculus glabra</i>	Ohio Buckeye
<i>Taxodium distichum</i>	Bald Cypress
<i>Rhus typhinia</i>	Staghorn Sumac

Of the remaining seven plots, several of the trees had survived into their ninth year, though mortality was high. DHE estimates approximately 40% survival since the initial planting. No significant additional tree mortality was observed since the Spring 2020 monitoring event, likely due to an average year of precipitation. The prior years' mortality observed was due to a variety of factors, including poor soil conditions and heavy deer browse during the summer. In Fall, 2019, several containerized trees were added to the #5 plot in an effort to boost diversity and increase surviving trees and shrubs.

#### **4.0 WILDLIFE OBSERVATIONS**

Main observations of wildlife are limited to deer, birds, and various insects. Bluebirds, Field Sparrows, Turkey Vultures and Meadowlarks were observed utilizing trees in the plots. Numerous dragonflies and honeybees were also present. In time, the mature trees will attract other species that prefer the woody cover to the rest of the landfill grasses.

## **5.0 RECOMMENDATIONS**

Approximately 40% of the trees were present into their eleventh year after planting and a healthy understory was in place. The remaining trees and shrubs appeared stressed or dead and showed evidence of deer browsing and drought toll.

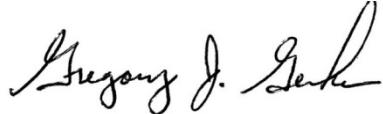

Adequate markers showing the edges of the plots should be erected so that mowers and landfill traffic can avoid the plots.

No further corrective actions are recommended at this time.

If you have any questions regarding this monitoring report or the recommendations made within, please contact us at (317) 446-1567.

Sincerely,

DHE, INC.

Gregory J. Gerke, PWS, CESSWI  
Senior Ecologist
