## EXECUTIVE SUMMARY

KERAMIDA, Inc. was contracted by Harman Becker Automotive Systems, Inc. to design and implement a groundwater remediation system to mitigate identified volatile organic compound (VOC) groundwater contamination along the western property boundary to reduce concentrations leaving their facility located in Martinsville, Indiana (Site). This report documents information collected during remediation activities from October through December 2008 and evaluates remediation performance.

An existing remediation system consisting of air sparging (AS) and soil vapor extraction (SVE) at the Site was modified to mitigate VOC groundwater contamination along the western property boundary. This effort is the second part of a two-part remediation strategy involving (1) treatment of the VOC source area in the eastern parking lot (currently on-going and documented separately), and (2) treatment of the downgradient portion of the on-Site groundwater plume to reduce VOCs leaving the Site and impact to sensitive receptors. Therefore, a modified SVE/AS system was designed and subsequently installed in June and July 2006 and became fully operational in July 2007.

### *Soil and Groundwater*

Quarterly groundwater sampling is recommended in select monitoring wells west of the plant and in the adjacent neighborhood to evaluate system performance and off-Site vapor intrusion pathway. Additional soil and groundwater sampling in the vicinity of MW-17 is recommended to investigate the extent of elevated groundwater concentrations in this well.

### *Remediation System*

The remediation system was not operational from early June 2008 through August 21, 2008 due to high water levels caused by flooding within the City of Martinsville. The AS/SVE system was restarted on August 21, 2008, once groundwater levels had receded to pre-flood levels. At this time, KERAMIDA began to conduct more frequent visits than the normally scheduled two visits per month in order to monitor the AS/SVE system's operation. The more frequent visits were necessitated based on KERAMIDA's concerns over the impact of the flood to the AS/SVE system and the observed lower, as well as higher, ROIs seen in comparison to the ROIs obtained prior to the flood. KERAMIDA concluded that the operational problems experienced during that period were rather systemic, indicating potential damage to the AS/SVE system and/or short-

circuiting impacts to the area of the system from the flood. As a result, diagnostic testing was performed in March 2009 in order to evaluate the performance of the Site's AS/SVE system, and determine the overall integrity of the system's subsurface infrastructure. Based on KERAMIDA's evaluation, the following are recommended:

- The replacement of the SVE wells in the remediation corridor with a horizontal SVE trench, as part of an expanded SVE system.
- The replacement air sparge points AS-9, AS-10 and AS-18R, as part of an expansion and rehabilitation of the AS/SVE system.

**KERAMIDA PROJECT NO. 11913**

**1.0 INTRODUCTION**

KERAMIDA Inc. was contracted by Harman Becker Automotive Systems, Inc. (Harman) to design and implement a groundwater remediation system to mitigate identified volatile organic compound (VOC) groundwater contamination along the western property boundary to reduce concentrations leaving their facility located in Martinsville, Indiana (Site). The Site is located at 1201 South Ohio Street, Martinsville, Morgan County, Indiana (see Figure 1). The Site is being administered through the Indiana Department of Environmental Management (IDEM) State Cleanup Program.

The purpose of this report is to document and evaluate the progress of the implemented remedial system at the Site. The remedial system consists of air sparging (AS) combined with soil vapor extraction (SVE). This report summarizes the following information:

- Contaminants of concern
- Design, installation and startup of the remediation system
- Operation and Maintenance of the remediation system
- Performance evaluation of the remediation system
- Conclusions and recommendations

**2.0 CONTAMINANTS OF CONCERN**

Identified contaminants of concern (COC) include VOCs such as tetrachloroethene (PCE), trichloroethene (TCE) and daughter products. VOC contamination along the western (downgradient) property boundary have been detected in groundwater at concentrations greater than the IDEM Risk Integrated System of Closure (RISC) default residential and industrial/commercial closure levels.

### **3.0 REMEDIATION SYSTEM OVERVIEW**

The focus of the remediation system is to mitigate off-Site migration of contamination along the western property boundary where VOCs have been detected in groundwater at concentrations greater than the IDEM RISC default residential and industrial/commercial closure levels. This effort is the second part of a two-part remediation strategy involving (1) treatment of the VOC source area in the eastern parking lot (currently on-going), and (2) treatment of the downgradient portion of the on-Site groundwater plume to reduce VOCs leaving the Site and impact to sensitive receptors. The progress of treatment of the VOC source is being documented in separate reports.

To reduce VOC concentrations leaving the Site, the existing AS/SVE System was modified. The current AS/SVE System consists of a total of 7 AS points and 10 SVE wells outside the Harman facility building along the western property line. SVE wells are equipped with control valves and vacuum gauges, while the AS wells are equipped the control valves and pressure gauges. Subsurface vapor extraction and compressed air piping connect these wells to the existing above-grade piping and remedial equipment located inside the Harman facility. The remedial equipment includes both vapor extraction and compressed air systems. The vapor extraction system includes an SVE blower unit, vacuum relief valve, dilution air valve with filter, air/water separator, water discharge pump and associated piping, instrumentation and controls. The compressed air system includes a manifold connected to the facility's existing air compressor system (process air for facility) that compressed air is directed to the remedial effort and associated piping, instrumentation and controls. The remediation system was started mid-July and August 2007. A layout of the modified system can be found on Figure 2 - As-Built Site Plan.

A complete summary of the design, permitting, installation, startup and initial operation and maintenance (O&M) of the remediation system was documented in the Remediation System Startup & Evaluation Report, July 2007 through March 2008, dated May 2, 2008.

#### **4.0 GROUNDWATER MONITORING**

As documented in Section 4.3.2 of the Remediation System Evaluation Report, July through September 2008 dated June 12, 2009, the most recent groundwater data from wells in the vicinity of the AS/SVE system show significant reduction in concentrations in all of the wells, with the exception of PCE and TCE in MW-17. There may be various reasons for these increases, however, KERAMIDA re-sampled MW-17, on December 30, 2008, to verify the data. The groundwater sample was analyzed by Heritage Environmental Services, LLC. of Indianapolis, Indiana. The Groundwater Sample Information Sheet and laboratory analytical report from the re-sampling of MW-17 is provided in Attachment 1. Select laboratory data is tabulated below.

Sample ID.	MW-17		
Date	1/10/07*	10/7/08	12/30/08
cDCE	480	62	22
tDCE	10	5.8	1.9
PCE	130	970	1,100
TCE	46	69	52
VC	97	<1.0	<1.0

\* Results prior to active remediation

Data from the re-sampling of groundwater at MW-17 verifies groundwater concentrations from this well's October 2008 sampling event. Significant concentrations of PCE and TCE remain in this area of the Site. High PCE concentrations (3,730,000 ug/m<sup>3</sup>) detected in an air sample from beneath the warehouse floor just east of MW-17 suggests a potential additional source in the area.

#### **5.0 REMEDIATION SYSTEM O&M AND PERFORMANCE**

Operations, maintenance, performance and liquid waste management are detailed below. O&M Logs are provided as Attachment 2, Operational Logs used to document applied vacuum/pressure levels are provided as Attachment 3, Performance Data Logs that document induced levels used in determining radii of influence (ROIs) are provided in Attachment 4, ROIs are depicted on Figure 3 – As-Built Site Plan with AS/SVE Influence (Post-June 2008) and vapor sampling analytical/discharge calculations are provided as Attachment 5.

## **5.1 OPERATIONS**

The remediation system was started in July 2007 and went through an adjustment and calibration period, prior to being fully operational in January 2008. Through December 30, 2008 it has operated for a total of 8,648.75 hours. The remedial system operated 86% of the time from October through December 2008. Various operational and performance data were collected during O&M visits. Tasks completed during the O&M visits are as follows:

- Bi-weekly operational measurements from AS and SVE systems.
- Monthly collection of effluent vapor samples for VOC analysis.
- Monthly collection of an effluent condensate water sample, if necessary, for VOC and pH analysis.
- Monthly balancing of applied vacuum and pressures at SVE and AS wells to optimize performance.
- Performance data collection events to collect observed, applied, and induced vacuum, pressure, groundwater (mounding), DO and ORP levels. These performance data were collected at various SVE, AS and monitoring points to verify ROIs.

## **5.2 MAINTENANCE**

Various maintenance items were completed during the operation of the remediation system. This included an attempt to establish a connection between the SVE flow meter and the programmable logic controller (PLC) and various system restarts. The oil was also changed in the SVE blower.

EOS Research who manufactures the PLC unit aided in the attempt to establish a connection between the SVE flow meter and the PLC. A connection could not be established, therefore the SVE flow meter was removed and shipped to the manufacturer for further testing. The SVE flow meter's electronics were damaged beyond repair by an electrical surge. Multiple attempts to install and operate a flow meter that can be monitored through the PLC have been made and have been unsuccessful. Therefore, a pitot tube and magnahelic gauge calibrated to directly read air flow will be installed. SVE air flow will not be accessible through the PLC, but this will not affect the operation of the system.

The system shut down twice in early December 2008 while Harman personnel conducted maintenance on their compressed air systems. The remediation system was restarted by KERAMIDA following each shut down event.

The AS/SVE system was restarted on August 21, 2008, following the June 2008 flood as discussed in Section 5.2 of the Remediation System Evaluation Report, July through September 2008, dated June 12, 2009. At this time, KERAMIDA began to conduct more frequent visits than the normally scheduled two visits per month in order to monitor the AS/SVE system's operation. The more frequent visits were necessitated based on KERAMIDA's concerns over the impact of the flood to the AS/SVE system and the observed lower, as well as higher, ROIs seen in comparison to the ROIs obtained prior to the flood. KERAMIDA concluded that the operational problems experienced during that period were rather systemic, indicating potential damage to the AS/SVE system and/or short-circuiting impacts to the area of the system from the flood. As a result, KERAMIDA recommended diagnostic testing of the AS/SVE system be conducted. Diagnostic testing was then performed in March 2009 as summarized below in Section 6.0 and documented in the Remediation System Diagnostics Report dated June 12, 2009.

### 5.3 PERFORMANCE

To verify the effectiveness of the SVE portion of the system in capturing vapors liberated by the AS portion of the system and the effectiveness of the AS portion of the system to liberate vapors, current ROIs and VOC vapor discharge rates must be determined and compared to design and startup conditions. Methodology for determining ROIs using collected performance data for both portions of the remediation system are detailed within the Performance Data Review document in Attachment 3.

The following table summarizes design, start-up and current operating conditions and associated system performance information.

Parameter	Design Conditions and Performance	Start-up Conditions and Performance	Current Conditions and Performance
SVE Wells	45-50" H <sub>2</sub> O at 35cfm 25-foot ROI	6-16" H <sub>2</sub> O at 35cfm 20-27-foot ROI	14-20" H <sub>2</sub> O at 28cfm 23-foot ROI (Average)
AS Wells	35psi at 10cfm 30-foot ROI	25psi at 16-26cfm 32-foot ROI	25psi at 21cfm 25-foot ROI

Differences between the designed, start-up and current conditions and performance of the SVE portion of system are evident as depicted above. The design indicated an applied vacuum per well of 45-50" H<sub>2</sub>O would induce an ROI of approximately 25 feet. Start-up conditions indicated a significantly lower applied vacuum/well of 6-16" H<sub>2</sub>O, resulting in an ROI of approximately 20-27 feet, while current conditions result in an ROI of 23-feet (average) using an applied vacuum of approximately 14-20" H<sub>2</sub>O. The spacing between SVE wells is approximately 40 feet.

As detailed in Section 5.3 of the Remediation System Evaluation Report, July through September 2008, dated June 12, 2009, a decrease in the SVE ROI (18-feet) was observed in the 3<sup>rd</sup> quarter of 2008 as compared to the SVE ROI (25-feet) seen in the 2<sup>nd</sup> quarter of 2008. The 2<sup>nd</sup> and 3<sup>rd</sup> quarter's SVE ROIs were determined using data collected from a single event. The 4<sup>th</sup> quarter SVE ROI of 23-feet is based on multiple data collection events during all three months of the quarter. Based on this information, the SVE ROI for both the 3<sup>rd</sup> and 4<sup>th</sup> quarters of 2008 is 23-feet (Figure 3).

Differences also are evident between the design, start-up and current conditions and performance of the AS portion as depicted above. The design calls for an injection of 10 cfm of air at pressure of 35 psi to achieve an ROI of approximately 30 feet. Startup conditions indicate air injection at 25 psi can achieve an ROI of approximately 30 feet. However, current conditions indicate an ROI of approximately 25-feet is achieved at an injection rate of 25 psi. The spacing between AS wells is approximately 50 feet.

During the reporting period, total SVE airflow was approximately 280 cfm (28 cfm/well x 10 wells) while AS airflow was approximately 150 cfm (21 cfm/well x 7 wells). Therefore, approximately twice as much air is being removed from the subsurface than is being injected. Currently (2009), the SVE portion of the system is removing air at 335-360 cfm compared to the injection of 150 cfm air by the AS portion.

Vapor discharge rates, for each vapor sampling event, were determined by using vapor sampling analytical data and flow measurements taken from the SVE blower's effluent stack. Time periods were determined based on the occurrence of vapor sampling events with associated operational hours. Using these data, KERAMIDA estimates approximately 0.99 pounds of VOC vapors have been removed from the subsurface by the remediation system during the current

monitoring period. An estimated total of 31.3 pounds of VOC vapors have been removed from the subsurface since startup in July 2007.

#### **5.4 LIQUID WASTE MANAGEMENT**

Liquid wastes were generated by the drainage of condensate from the SVE's air/water separator and in-line condensate sumps. During Site visits, any accumulated condensate is pumped from the air/water separator and sumps to the City of Martinsville sewer system. From July 2007 through December 2008, a total of 1,279-gallons of condensate waters were generated and discharged. Monthly discharge reports are generated and submitted to the Martinsville City Engineer and Utility Office.

### **6.0 CONCLUSIONS AND RECOMENDATIONS**

#### *Groundwater*

Quarterly groundwater sampling is also recommended in select monitoring wells west of the plant (MW-9, MW-10, MW-17) and in the adjacent neighborhood (MW-22, MW-23, MW-27) to evaluate system performance and off-Site vapor intrusion pathway. Data from the re-sampling of groundwater at MW-17 verified high groundwater concentrations from this well's October 2008 sampling event. High PCE concentrations (3,730,000 ug/m<sup>3</sup>) detected in an air sample from beneath the warehouse floor just east of MW-17 suggests a potential additional source in the area. Additional soil and groundwater sampling in the vicinity of MW-17 is recommended.

#### *Remediation System*

Due to operational changes observed subsequent to the June 2008 flooding event, KERAMIDA performed diagnostic testing in March 2009. Testing was performed in order to evaluate the performance of the Site's AS/SVE system, and determine the overall integrity of the system's subsurface infrastructure. KERAMIDA's findings from this evaluation, as documented in the Remediation System Diagnostics Report dated June 12, 2009, include the following:

#### Air Sparge System

- Air sparge points AS-9 and AS-10 were incapable of holding pressure during the March 2009 diagnostic testing and went to zero pressure shortly after their pressurization at 26 psi. The loss of pressure from the sparge points is indicative of leakage that most likely was caused by shifting forces due to the flood's impact. The leakage is expected to result in lower

performance of these points. KERAMIDA recommends replacement of these wells as part of an expansion and rehabilitation of the AS/SVE system. Air sparge point AS-18R, while it did not lose pressure as quickly as the other two points, was also incapable of holding pressure and went eventually to zero pressure. KERAMIDA recommends replacement of this well as part of an expansion and rehabilitation of the AS/SVE system. All three problematic AS wells are old Heritage wells installed in 1996. The functioning AS wells were placed by KERAMIDA in 2006.

#### Soil Vapor Extraction System

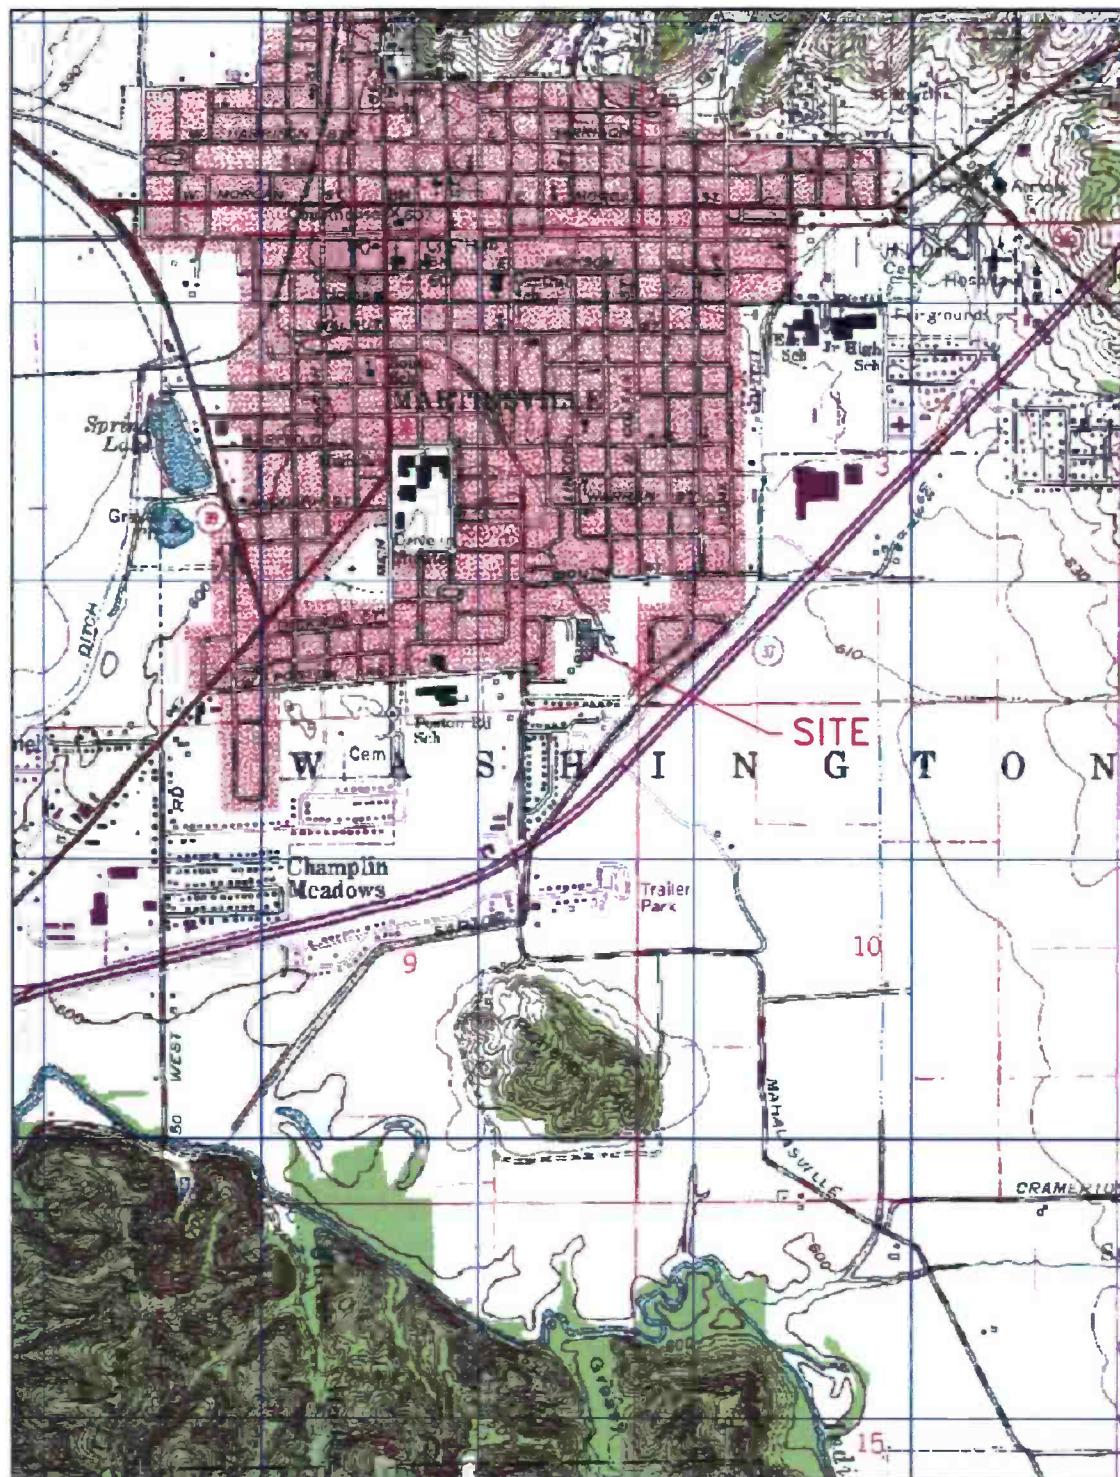

- The vapor extraction radius of influence around SVE-D was found to range between approximately 22 and 32 feet under the two operating scenarios tested. These observations are consistent with those historically reported at this well.
- The radii of influence for the SVE wells, in general, have been found to be somewhat variable, which is believed to be a function of preferential flow paths resulting from the close proximity of utility conduits to the SVE wells, and the impact of the 2008 flood to the fill materials of the utility line trenches.
- The variability in the resulting airflow observed at the SVE wells under steady-state applied vacuum, is believed to be due to the presence of preferential flow paths resulting from the close proximity of utility conduits to the SVE wells and the impact of the 2008 flood to the fill materials of the utility line trenches.
- KERAMIDA recommends the replacement of the SVE wells in the remediation corridor with a horizontal SVE trench, as part of an expanded SVE system.

## 7.0 USE OF REPORT

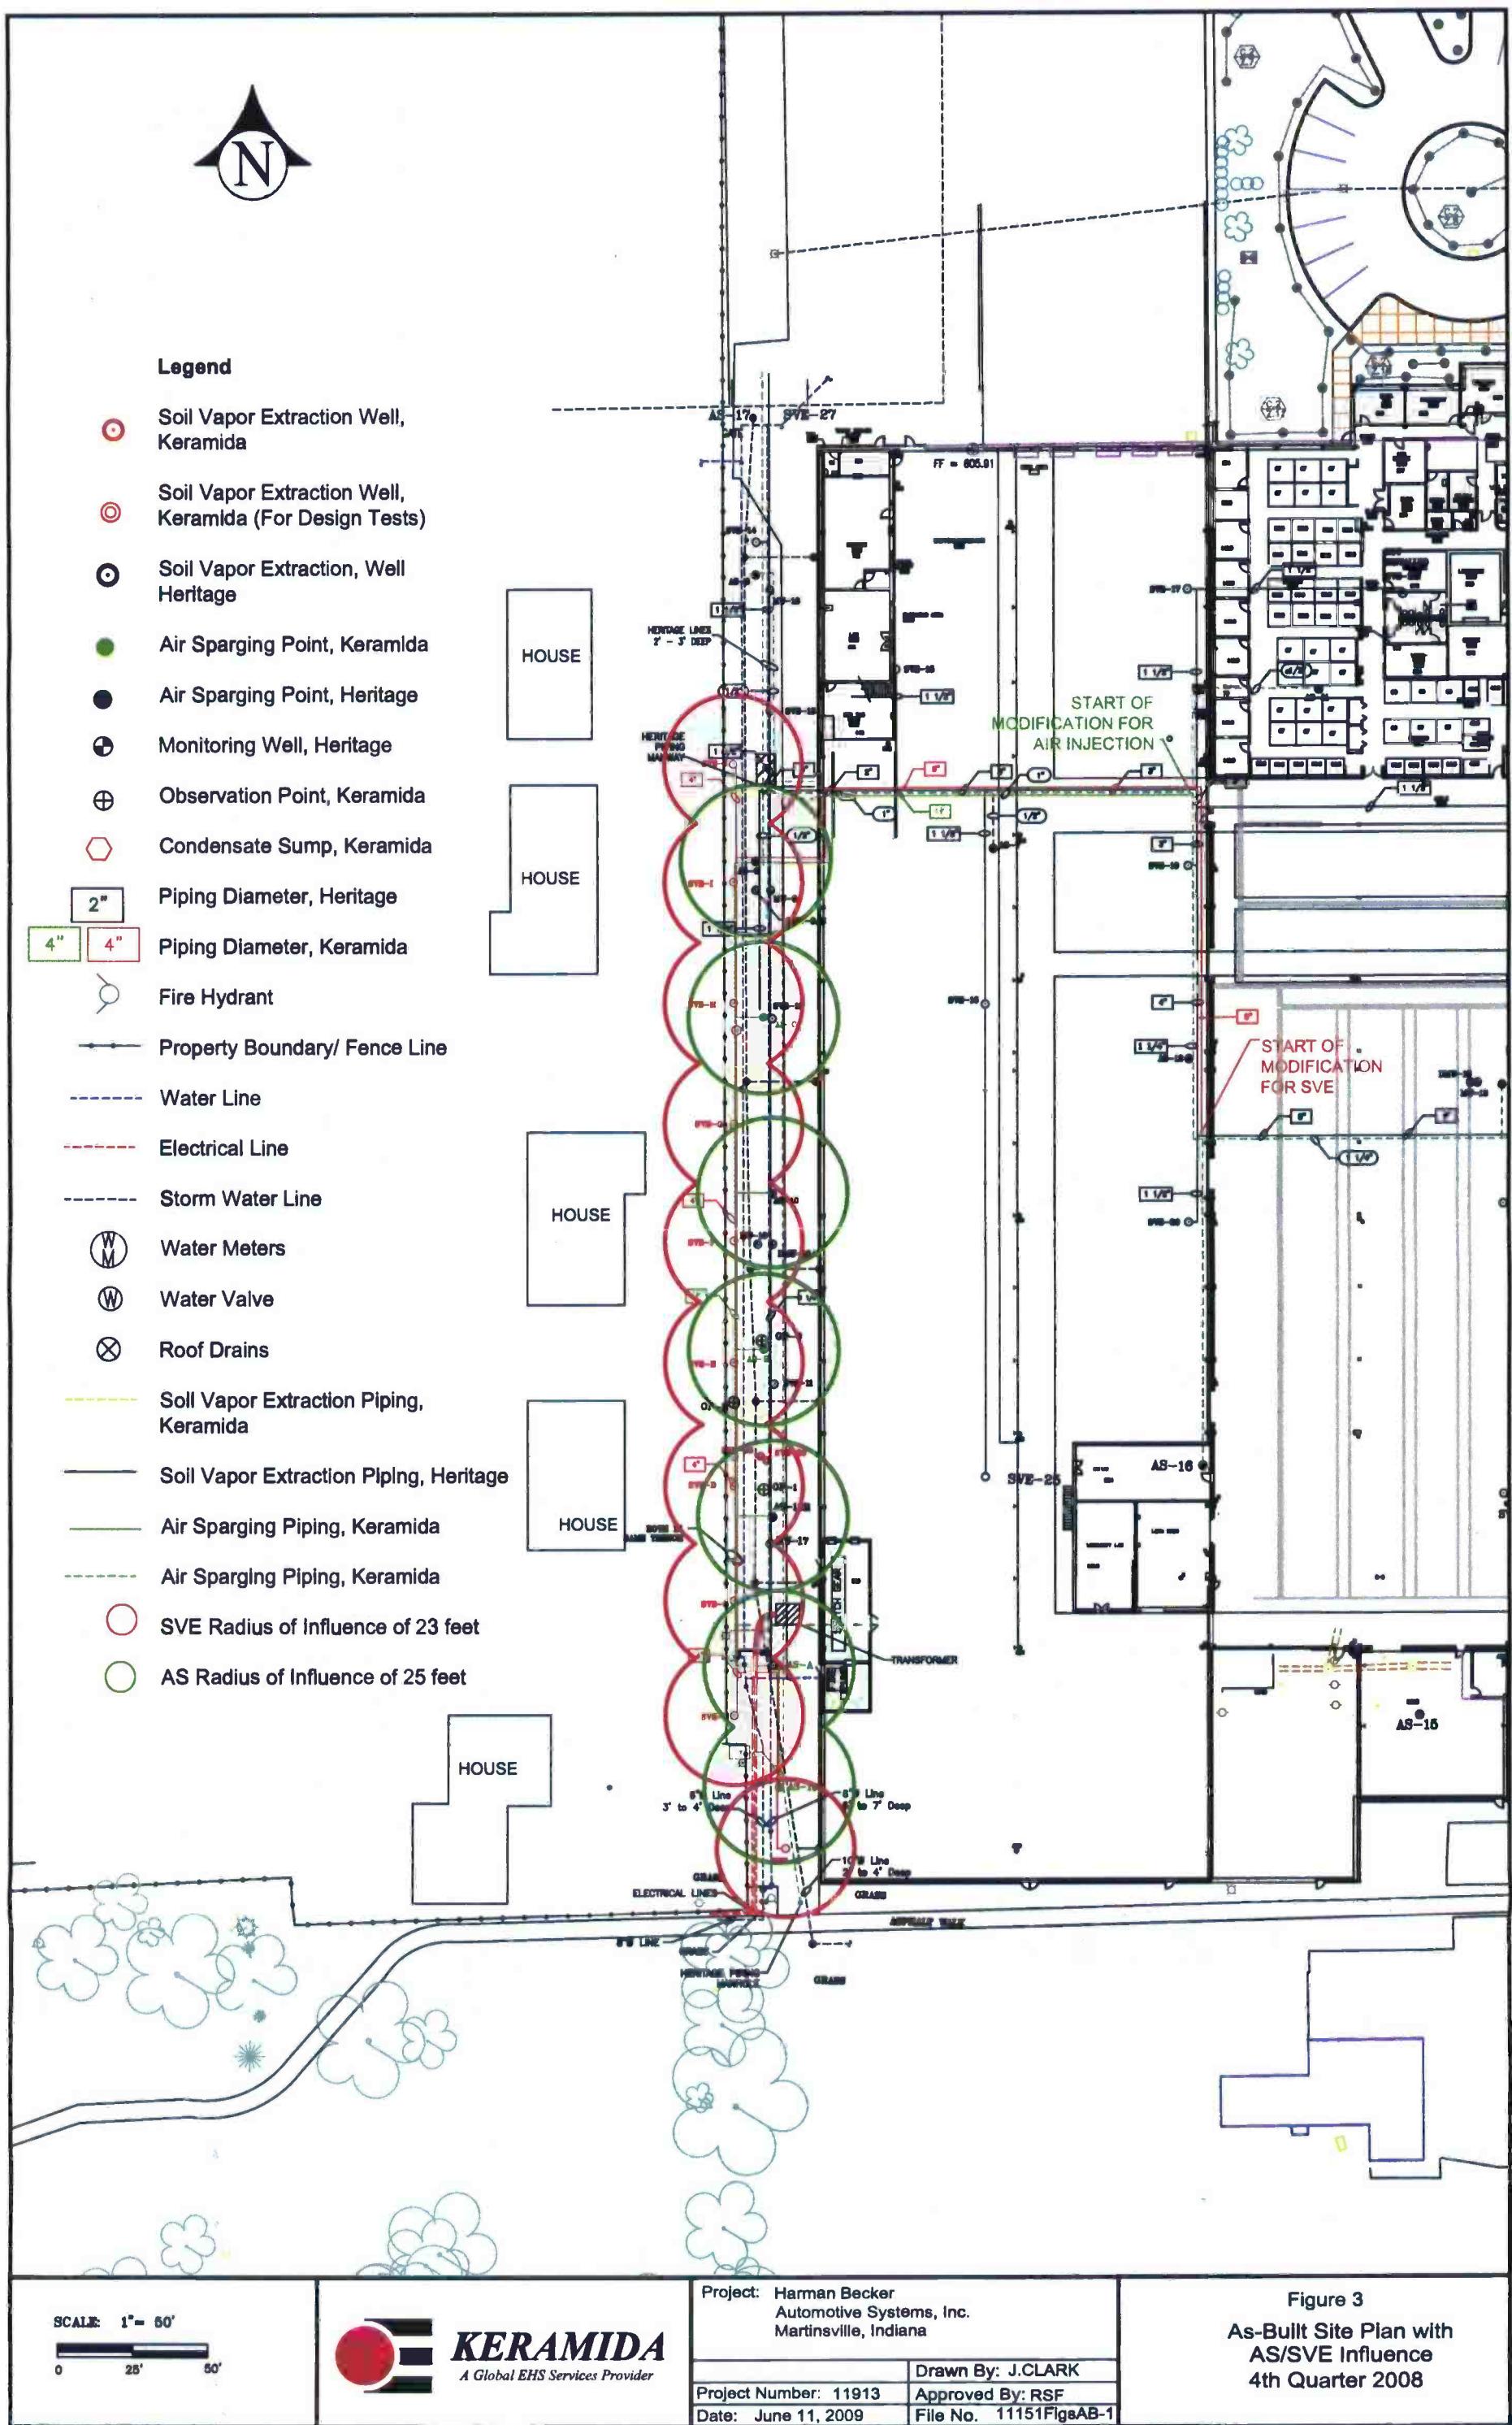

This report has been prepared for the exclusive use of the Client and persons or organizations to whom the Client wishes to make this report available. This report and the findings, conclusions and recommendations contained herein shall not, in whole or in part, be disseminated or conveyed to any other party, or used by or relied upon by any other party, without the prior written consent of KERAMIDA.

## **8.0      LIMITATIONS**

This report was prepared in accordance with KERAMIDA contractual guidelines set forth for remediation services. KERAMIDA's professional opinions contained herein are based upon the operation, maintenance, and monitoring/sampling conducted by KERAMIDA personnel during the operation of the remediation system. No other warranty is given or implied by this report.

## Sample Comments

BDL Below Detection Limit

EX Exceeds calibration range. See Replicate

Sample was received on ice at temperature 2.4 C.

Sample chain of custody number 6312.

This Certificate shall not be reproduced, except in full,  
without the written approval of the lab.

The sample results relate only to the analytes of interest tested  
or to the sample as received by the lab.

Heritage Environmental Services, LLC certifies that the test results

**NOTES:** System was down upon arrival. Spoke w/Bill Fowler in (Maintenance) he said he ran Little Green with Big Green for a day then Little Green went down & he couldn't get it to run again. I found that when our system went down it had locked out "Little Green" and it had to be restarted through our controller. It ran fine after that and Bill and I adjusted "Little Green" to get the correct pressure and flow to our system.

All is up and running and we control all aspects of the operation now. Because the factory isn't using any air. Bill said he would come in and run the Big compressor over weekends while no one was there because it is more reliable.

Checked pressure in vault at 25 psi  
TIME: 4.5 HR

KERAMIDA  
JAN 07 2009  
RECEIVED

12/30/2008

Mr. Rob Fedorchak  
Keramida Environmental, Inc.  
401 N. College AVE  
Indianapolis, IN 46202

Dear Rob:

Enclosed are the sample data report, chain of custody record and quality control data for the sample received on December 22, 2008 for your project; 11913 - HBAS.

Please give me a call if you have questions or I can be of further assistance. Thank you for using Vaportech Services.

Sincerely,

A handwritten signature in cursive ink that appears to read "David J. Masdea".

David J. Masdea

KERAMIDA  
REC'D 042008  
RECEIVED

Mr. Rob Fedorchak  
Keramida Environmental, Inc.  
401 N. College AVE  
Indianapolis, IN 46202

Dear Rob:

Enclosed are the sample data report, chain of custody record and quality control data for the sample received on November 25, 2008 for your project; 11913 - HBAS.

Please give me a call if you have questions or I can be of further assistance. Thank you for using Vaportech Services.

Sincerely,

A handwritten signature in black ink that appears to read "David J. Masdea".
