Final Concentration = ((Soln Conc x Prep Final Vol x Dilution) / (Prep Amount x Solids)) x Unit Factor

U: Undetected at or above MDL
J: Analyte detected above MDL, but below MRL
B: Hit above MRL also found in Method Blank
E: Analyte concentration above high point of ICAL
N: Presumptive evidence of compound

D: Result from dilution
m: Manual integration performed
d: Compound manually deleted
NR: Analyte not reported from this analysis

*: Result fails acceptance criteria
#: Acceptance criteria not applicable
?: Insufficient information to determine acceptance
e: Result >= MRL, but MRL less than low point of ICAL
c: check for co-elution

U: Undetected at or above MDL
J: Analyte detected above MDL, but below MRL
B: Hit above MRL also found in Method Blank
E: Analyte concentration above high point of ICAL
N: Presumptive evidence of compound

D: Result from dilution
m: Manual integration performed
d: Compound manually deleted
NR: Analyte not reported from this analysis

*: Result fails acceptance criteria
#: Acceptance criteria not applicable
?: Insufficient information to determine acceptance
e: Result >= MRL, but MRL less than low point of ICAL
c: check for co-elution

Date Received: 10/27/2003

Semi-Volatile Organic Compounds by GC/MS

Sample Name: SED-4DMS
Lab Code: KWG0317457-2

Extraction Method: EPA 3541
Analysis Method: 8270C

Units: ug/Kg
Basis: Dry

Level: Low

Analyte Name	Result	Q	MRL	Dilution Factor	Date Extracted	Date Analyzed	Extraction Lot	Note
Phenol	**207**	D	170	5	10/30/03	11/18/03	KWG0317457	
2-Methylphenol	**79.2**	D	57	5	10/30/03	11/18/03	KWG0317457	
4-Methylphenol†	**89.4**	D	57	5	10/30/03	11/18/03	KWG0317457	
2,4-Dimethylphenol	**25.1**	D	290	5	10/30/03	11/18/03	KWG0317457	
2,4-Dichlorophenol	**202**	D	57	5	10/30/03	11/18/03	KWG0317457	
2,4,6-Trichlorophenol	**212**	D	57	5	10/30/03	11/18/03	KWG0317457	
Pentachlorophenol	**169**	D	290	5	10/30/03	11/18/03	KWG0317457	
Butyl Benzyl Phthalate	**329**	D	57	5	10/30/03	11/18/03	KWG0317457	
Bis(2-ethylhexyl) Phthalate	**543**	D	1200	5	10/30/03	11/18/03	KWG0317457	

Surrogate Name	%Rec	Control Limits	Date Analyzed	Note
Phenol-d6	80	40-123	11/18/03	Acceptable
2,4,6-Tribromophenol	72	35-138	11/18/03	Acceptable
Terphenyl-d14	106	56-152	11/18/03	Acceptable

† Analyte Comments

4-Methylphenol	This analyte cannot be separated from 3-Methylphenol.

Comments:

U: Undetected at or above MDL
J: Analyte detected above MDL, but below MRL
B: Hit above MRL also found in Method Blank
E: Analyte concentration above high point of ICAL
N: Presumptive evidence of compound

D: Result from dilution
m: Manual integration performed
d: Compound manually deleted
NR: Analyte not reported from this analysis

*: Result fails acceptance criteria
#: Acceptance criteria not applicable
?: Insufficient information to determine acceptance
e: Result >= MRL, but MRL less than low point of ICAL
c: check for co-elution

Extract Storage: —

Date Completed: 11/4/03

Comments/Observations:

Bench Sheet Review Check List
☑ Hold Times Met (if no, Reason:)
☑ Prep date, dept, method, product code correct in stealth
☑ Spike Information correct
☑ Weights/Volumes and units correct on raw and final bench sheets
☑ Sample IDs have been checked—Bottle numbers appended if required
☑ Names present for: Started by, Completed by, relinquished by, and witnessed by.
☑ Training has been circled
☑ Extract Storage recorded
☑ Additional Prep Sheet completely filled out (NA or line out Blanks)
☑ All clean-ups have been noted on additional prep sheet
☑ Signed service request with Form V, if applicable, has been attached

Lab Control Sample/Duplicate Lab Control Sample Summary
Semi-Volatile Organic Compounds by GC/MS

Sample Name:	Lab Control Sample	**Sample Name:**	Duplicate Lab Control Sample
Lab Code:	KWG0318722-1	**Lab Code:**	KWG0318722-2
File ID:	J:\MS10\DATA\112403\1124F026.D	**File ID:**	J:\MS10\DATA\112403\1124F027.D
Instrument ID:	MS10	**Instrument ID:**	MS10
Date Extracted:	11/20/2003	**Date Extracted:**	11/20/2003
Date Analyzed:	11/25/2003	**Date Analyzed:**	11/25/2003
Time Analyzed:	20:35	**Time Analyzed:**	21:16

Extraction Method:	EPA 3541	**Level:**	Low
Analysis Method:	8270C	**Extraction Lot:**	KWG0318722

These Lab Control Samples apply to the following analyses:

Sample Name	Lab Code	File ID	Date Analyzed	Time Analyzed
Method Blank	KWG0318722-3	J:\MS10\DATA\112403\1124F025.D	11/25/03	19:53
SED-5	K2308433-006	J:\MS10\DATA\112403\1124F028.D	11/25/03	21:57
SED-6	K2308433-007	J:\MS10\DATA\112403\1124F029.D	11/25/03	22:38
SED-8	K2308433-009	J:\MS10\DATA\112403\1124F030.D	11/25/03	23:19

U: Undetected at or above MDL
J: Analyte detected above MDL, but below MRL
B: Hit above MRL also found in Method Blank
E: Analyte concentration above high point of ICAL
N: Presumptive evidence of compound

D: Result from dilution
m: Manual integration performed
d: Compound manually deleted
NR: Analyte not reported from this analysis

*: Result fails acceptance criteria
#: Acceptance criteria not applicable
?: Insufficient information to determine acceptance
e: Result >= MRL, but MRL less than low point of ICAL
c: check for co-elution

(6) Calculate the True Final Volume	2	2	(ml)	1 / 2	

(1) x (3) x (5) = (6) / (2) x (4)

C. Does a split for PCB's or PAH's need to be done? YES (NO)

Checklist for the GPC Run:

1. ✓ Is the column reservoir full?
2. ✓ Is the rinse reservoir full?
3. ✓ Is the waste bottle empty?
4. ✓ Did you check the flow rate?
5. ✓ Is there a collection vessel for each extract tube?
6. ✓ Do the extract tube labels correspond to the collection vessel labels?
7. ✓ Are the extracts diluted properly, if needed?
8. ✓ Are all extracts filtered? (They **MUST** be)
9. ✓ Did you record where you put the remaining extract?
10. ✓ Is the correct method/collection window programmed?
11. ✓ Is the By-pass valve set to **In-line**?
12. ✓ Is the run log filled out?
13. ✓ Is sample load time set correctly for extract with lowest volume? **(VERY IMPORTANT)**
14. ✓ Is the nitrogen tank valve open?
15. ✓ Is there enough nitrogen (at least 500lb/23 extracts)?
16. ✓ Did you double check your GPC setup?

Bench Sheet Review Check List	
☐	Hold Times Met (if no, Reason: Reextracts)
☑	Prep date, dept, method, product code correct in stealth
☑	Spike Information correct
☑	Weights/Volumes and units correct on raw and final bench sheets
☑	Sample IDs have been checked—Bottle numbers appended if required
☑	Names present for: Started by, Completed by, relinquished by, and witnessed by.
☑	Training has been circled
☑	Extract Storage recorded
☑	Additional Prep Sheet completely filled out (NA or line out Blanks)
☑	All clean-ups have been noted on additional prep sheet
☐	Signed service request with Form V, if applicable, has been attached

Appendix from EXT-3541
for Extracting Compounds in Soil or Tissue by EPA Method 3541

Procedure:

Note: a) All anhydrous sodium sulfate (Na_2SO_4) used in this procedure must be thoroughly rinsed with methylene chloride (DCM).

b) Tissue samples require a pre-prep homogenizing procedure before extraction.

1. For low level work follow the low level glassware cleaning procedure.
2. Run the rinse cycle on Soxtherms prior to sample extraction. See EXT-3541 SOP and Operation Manual for programing instructions.

Prog. =01, Temp. limit=200°, Ext. temp =120°, Boil time=10m., Red. A=1x15ml., Ext. time=10m., Red B=1x15ml., sol. cool=30m., Red. int. =5m., Red pulse=5s., time 30m.

3. All lab equipment that will have contact with the sample must be thoroughly rinsed with the extraction solvent.
4. Thoroughly mix sample. Decant water, remove large rocks, sticks, leaves and other organic matter unless this is the primary make-up of the sample. Weigh approximately *initial weigh*grams wet weight into a 150ml beaker. Record Weight to the nearest 0.1 gram.
5. Weigh an equal amount of granular anhydrous Na_2SO_4 for the MB and LCS(s). Sediments require dup LCS's. For sediments and tissues weigh 5 grams of the appropriate SRM for analysis.
6. Mix sample with anhydrous Na_2SO_4 * until sample is sandy and free flowing. Be careful with amount of sulfate used so as not to overload thimble capacity. Multiple thimbles may be used.
7. Transfer dried extract to assembled Soxtherm thimble. Careful not to contaminate rinsed labware.
8. Add surrogate and matrix spikes. See chart. **(Witnessed by a trained analyst)**
9. Add enough DCM to cover samples completely.
10. Place sample on Soxtherm and run the associated program. See EXT-3541 SOP and Operation Manual for programing instructions.

Prog. =04, Temp. limit=200°, Ext. temp =120°, Boil time=1h., Red. A=6x15ml., Ext. time=1h., Red B=3x15ml., sol. cool=30m., Red. int. =5m., Red pulse=5s., time 3h3m.

11. Be careful that the extract does not go dry. The goal is a volume of 10 to 20 ml. after reductions. Samples are removed and immediately covered in foil as soon as this level is reached to allow other sample to continue the reduction step. Additional reduction may be required.
12. Quantitatively transfer the extract to culture tubes.
13. Based on sample analysis and compound list determine cleanup direction to take. See chart.
14. If cleanup is performed, only half the original extract is retained. Therefore the extract must be concentrated to 1/2 the final volume to achieve the correct "calculated" final volume.
15. Concentrate the extracts to < *calculated final volume*ml. on the N-Evap under a **gentle** stream of nitrogen with the temperature not exceeding 35°. Extreme caution must be used to ensure that the sample does not concentrate too low or to dryness.
16. Bring extracts to *calculated final volume* ml. in DCM and place in a labeled, *color*, 2ml autosampler vial.
17. Do FID screening. (see CAS SOP) Evaluate screen data.
18. Complete all necessary paperwork. Turn extracts and paperwork over to MS analysis.

Test	initial Weight	surrogate/ amount	spike/ amount	cleanup	color	calculated final volume
8270 / 625	30 grams	AP/1.0ml	8270+Benzidine/ 1.0 ml each	GPC as needed	clear	1 ml.

RE: Bloomington, IN / IN000072.0021

Dear Katrina:

Enclosed are the revised pages for the sample(s) submitted to our laboratory on October 27, 2003. For your reference, these analyses have been assigned our service request number K2308433.

Please call if you have any questions. My extension is 3316.

Respectfully submitted,

Columbia Analytical Services, Inc.

Jeff Christian
Laboratory Director

JC/afs

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
U	The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
i	The MRL/MDL has been elevated due to a matrix interference.
X	See case narrative.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
B	The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL has been elevated due to a matrix interference.
X	See case narrative.
*	The duplicate analysis not within control limits. See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results (25% for CLP Pesticides).
U	The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
i	The MRL/MDL has been elevated due to a chromatographic interference.
X	See case narrative.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Mansfield, Massachusetts

Report: #13395R
Review Level: Tier II
Project: IN000072.0052.00001

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # L1014191 for samples collected in association with the CSX Transportation Bloomington Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
					VOC	SVOC	PCB	MET	MISC
SED-15	L1014191-01	Water	9/8/10			X			X

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 8270C and 8270C (Alkylated PAHs) selective ion monitoring (SIM). Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The compound was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

  JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.

  UB Compound considered non-detect at the listed value due to associated blank contamination.

  N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

SEMI-VOLATILE VOLATILE ORGANIC COMPOUND (SVOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8270C	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cooled @ 4°C ± 2°C
	Sediment	14 days from collection to extraction and 40 days from extraction to analysis	Cooled @ 4°C ± 2°C
SW-846 8270C (PAH SIM)	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cooled @ 4°C ± 2°C
	Sediment	14 days from collection to extraction and 40 days from extraction to analysis	Cooled @ 4°C ± 2°C

The analyses that exceeded the holding are presented in the following table.

Sample Locations	Holding Time	Criteria
SED-15 (8270C)	15 Days	14 Days

Sample results associated with sample locations analyzed by analytical method SW-846 8260 were qualified, as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed. All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank

contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
SW-15	Bis(2-ethylhexyl)phthalate	Detected sample results >RL and <BAL	"UB" at detected sample concentration

RL Reporting limit

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

Sample locations associated with surrogates exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Surrogate	Recovery
SED-18 FD-1-100909	2,4,6-Tribromophenol	<LL but > 10%
	2-Fluorophenol	<LL but > 10%

LL Lower limit

The criteria used to evaluate the surrogate recoveries are presented in the following table. In the case of a surrogate deviation, the sample results associated with the deviant fraction are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	No Action
	Detect	J
< LL but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Surrogates diluted below the calibration curve due to the high concentration of a target compounds	Non-detect	J[1]
	Detect	

[1] A more concentrated analysis was not performed with surrogate compounds within the calibration range; therefore, no determination of extraction efficiency could be made.

4. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

Sample locations associated with LCS/LCSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Sample Locations	Compound	LCS Recovery	LCSD Recovery
SW-16 SW-17 SW-18 FD-1-100909 SW-19 SW-20 SW-21 SW-22 SW-23	Phenol	<LL but >10%	<LL but >10%

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

5. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Sample locations SW-18 and SED-18 were utilized as the MS/MSD. The MS/MSD exhibited acceptable recoveries and RPD between the MS/MSD recoveries, with the exception of the MS/MSD exhibiting recoveries outside of the control limits which are presented in the following table.

Sample Locations	Compound	MS Recovery	MSD Recovery
SED-18 (8270C)	2-Methylphenol	<LL but> 10%	AC
	2,4-Dimethylphenol	<10%	<10%
SED-18 (PAH SIM)	Naphthalene	>UL	>UL
	2-Methylnaphthalene	>UL	>UL
	Acenaphthylene	>UL	>UL
	Acenaphthene	>UL	>UL
	Fluorene	>UL	>UL
	Anthracene	>UL	>UL

AC Acceptable
UL Upper Limit
LL Lower limit

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration (D).	Detect	No Action
	Non-detect	

Sample locations associated with MS/MSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Sample Locations	Compound
SED-18 (8270C)	2-Methylphenol
SED-18 (PAH SIM)	Naphthalene
	2-Methylnaphthalene
	Acenaphthylene
	Acenaphthene
	Fluorene
	Anthracene

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	J
	Detect	J

6. Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

All analytes associated with laboratory duplicate RPD were within the control limit, with the exception of the analytes presented in the following table.

Sample Location	Analytes	Laboratory RPD
SED-18 (PAH SIM)	Naphthalene	40%
	C3- Naphthalenes	42%
	C4- Naphthalenes	46%
	Acenaphthylene	63%
	Fluorene	42%
	C1-Flourenes	58%
	C2-Flourenes	49%
	C3-Flourenes	45%
	C1-Phenanthrenes/Anthracenes	40%
	C2-Phenanthrenes/Anthracenes	53%
	C3-Phenanthrenes/Anthracenes	45%
	Anthracene	48%
	Fluoranthene	45%
	Pyrene	44%
	C1-Fluoranthenes/Pyrenes	47%
	Perylene	41%
	Indeno(1,2,3-cd)Pyrene	36%
	Dibenz(a,h)anthracene	43%

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	J
	Detect	J

7. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 50% for water matrices and 100% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
SED-18/FD-1-100909 (PAH SIM)	Naphthalene	26.4	40.1	NC
	C1- Naphthalenes	24.4	22.1	AC
	C2- Naphthalenes	35.9	40.9	AC

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
	C3- Naphthalenes	36.4	58.4	NC

AC Acceptable
NC Not compliant
ND Not detected

The compound(s) naphthalene, C3-naphthalenes, C4-naphthalenes, acenaphthene, C1-flourenes, C2-flourenes, phenanthrene and carbazole associated with sample locations SED-18 and FD-1-0100909 exhibited a field duplicate RPD greater than the control limit. The associated sample results from sample locations for the listed analytes were qualified as estimated.

8. Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Method 3020A (Hardness) and the Analysis of Soot by Accardi-Dey, Gschwend, 2003; Gustafsson (et al.), 1997"(%Soot). Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

    U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

    B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

    E The reported value is estimated due to the presence of interference.

    N Spiked sample recovery is not within control limits.

    * Duplicate analysis is not within control limits.

- Validation Qualifiers

    J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

    UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

    UB Analyte considered non-detect at the listed value due to associated blank contamination.

    R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Hardness by EPA 6020A	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2 s.u.
%Soot	Sediment	28 days from collection to analysis	--

su Standard Units

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Matrix Spike (MS)/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS recovery control limits do not apply for MS performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

All analytes associated with MS/MSD recoveries were within control limits.

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the

parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

All analytes associated with laboratory duplicate RPD were within the control limit for Hardness and %Soot.

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 100% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SED-18/FD-1-100909	%Soot (Rep 1)	1.35	4.20	103%
	%Soot (Rep 2)	1.43	2.77	64%
SW-18/FD-1-100909	Hardness	236	218	9.7%

The analyte %Soot (Rep 1) associated with samples locations SED-18 and FD-1-100909 exhibited a field duplicate RPD greater than the control limit. The associated sample results from sample locations for the listed analyte were qualified as estimated.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

6. Overall Assessment

Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

CSX Transportation

Data Review

BLOOMINGTON, INDIANNA

Semivolatile and Miscellaneous Analyses

SDG# L1013935

Analyses Performed By:
Alpha analytical Laboratories
Mansfield, Massachusetts

Report: #13394R
Review Level: Tier II
Project: IN000072.0052.00001

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # L1013935 for samples collected in association with the CSX Transportation Bloomington Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
					VOC	SVOC	PCB	MET	MISC
SW-09 (F76426-1)	L1013935-01	Water	9/8/10			X			X
SW-10 (F76426-3)	L1013935-02	Water	9/8/10			X			X

12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 8270C (Alkylated PAHs) and 8270C selective ion monitoring (SIM). Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The compound was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

  JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.

  UB Compound considered non-detect at the listed value due to associated blank contamination.

  N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

SEMI-VOLATILE VOLATILE ORGANIC COMPOUND (SVOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8270C	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cooled @ 4°C ± 2°C
	Sediment	14 days from collection to extraction and 40 days from extraction to analysis	Cooled @ 4°C ± 2°C
SW-846 8270C (PAH SIM)	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cooled @ 4°C ± 2°C
	Sediment	14 days from collection to extraction and 40 days from extraction to analysis	Cooled @ 4°C ± 2°C

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
SW-09 SW-14	Bis(2-ethylhexyl)phthalate	Detected sample results >RL and <BAL	"UB" at detected sample concentration

RL Reporting limit

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

Sample locations associated with surrogates exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Surrogate	Recovery
SED-14 (F76426-13)	2,4,6-Tribromophenol	< 10%

The criteria used to evaluate the surrogate recoveries are presented in the following table. In the case of a surrogate deviation, the sample results associated with the deviant fraction are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	No Action
	Detect	J
< LL but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Surrogates diluted below the calibration curve due to the high concentration of a target compounds	Non-detect	J[1]
	Detect	

[1] A more concentrated analysis was not performed with surrogate compounds within the calibration range; therefore, no determination of extraction efficiency could be made.

4. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

Sample locations associated with LCS/LCSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Sample Locations	Compound
SED-09 SED-10 SED-11 SED-13 SED-14(F76426-13)	Phenol

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

5. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

A MS/MSD was not performed on a sample location associated with this SDG.

6. Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

A laboratory duplicate was not performed on a sample location associated with this SDG.

7. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 100% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate was not collected with a sample location associated with this SDG.

8. Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Method 3020A (Hardness) and the Analysis of Soot by Accardi-Dey, Gschwend, 2003; Gustafsson (et al.), 1997"(%Soot). Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

    U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

    B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

    E The reported value is estimated due to the presence of interference.

    N Spiked sample recovery is not within control limits.

    * Duplicate analysis is not within control limits.

- Validation Qualifiers

    J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

    UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

    UB Analyte considered non-detect at the listed value due to associated blank contamination.

    R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Hardness by EPA 6020A	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
%Soot	Sediment	28 days from collection to analysis	--

su Standard Units

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Matrix Spike (MS)/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS recovery control limits do not apply for MS performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

A MS analysis was not performed on sample location associated with this SDG.

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the

parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

A laboratory duplicate was not performed with a sample location associated with this SDG.

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 100% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate was not collected with a sample location associated with this SDG.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

6. Overall Assessment

Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA VALIDATION CHECKLIST FOR GENERAL CHEMISTRY

General Chemistry: EPA 6020A and %Soot	Reported		Performance Acceptable		Not Required

D.S. Jones — CSX Bloomington
SW/SED for ERA

9-8-10

0800 Steve Sharp, Bryant Griggs, Randy Wheadruff, Dan Jones } ARCADIS — Sunny, No Rain in 24 hrs.

Stream Recon by all from County Club Road to downstream edge of Property/Stream ID of Excavation Areas Proposed By CSX and Proposed ~~SW~~ SW/SED Locations for ERA Sampling. Sharp - Griggs Depart ~1030.

1115 SW/SED-09
upstream of Remnant Dam/Pool
on Left Bank (Looking)
SW+SED Collected
Gravel, Sand Predominant. Clay (grey w/ black organic staining) at bottom
Water Depth ~6" at Sample Point

1305 Return from Lunch
Sample SW/SED-10
Just downstream of Dye
Tracer Discharge Point, Left
Bank (Looking), Mostly Sand/GRAVEL

D.S. Jones

CSX Bloomington
Sw/SED for ERA

9-8-10

1340 Sw/SED-11
Downstream Edge of Pool under Sycamore on Left Bank (Ascend), Mostly Bedrock, Sand, Gravel, Clay Layer (Tan) at Bottom of Core (~8-10" deep) - Some included in Samples for Lab. 3 Grabs in Comp.

1415 Sw/SED-12 ~Adj. Trans to Rm. 4
Near Center of Channel, ~12"-15" Deep Water. Sand + Gravel underlain by Tan Clay at ~6"-8" Down
Clay Layer Not included in Samples
3 Grabs - Composited

1445 Sw/SED-13
Left Bank (Ascend) in Sand Bar Targeted for Possible Removal.
Gravel and Sand, Mostly
~4" of water at Sed-13 Location

D.S. Jones
9-8-10

D.S. Jones

CSX Bloomington
Sw/SED for ERA

9-8-10

1515 Sw/SED-14
Mid Stream, ~8'-12" Water Depth
~15 ft downstream of Proposed Excavation Area. Mostly Gravel + Sand
~~9/8/15~~ Distinct Clay Layer (Grey/Black) at 6"-8" below Surface.

1545 Sw/SED-15
Midstream to Left bank (Ascend)
~1" to 4" of water. Mostly Sand, 3 Grab Samples for Composite
Small Sheen observed in Mixing bowl.

1615 Recon of Sites North of Country Club

1700 Pack + Ice Samples for Shipping

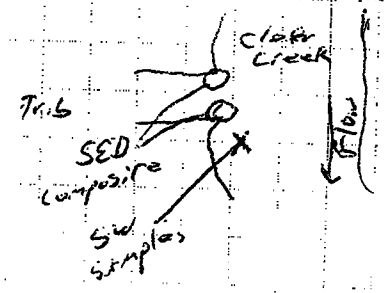
1730 DJ departs Site
RW Ships Samples

D.S. Jones
9-8-10

D.S. Jones

CSX Bloomington
SW/SED for ERA

9-9-10



0835 Tailgate Safety Mtg. — Matt Grubbs
Clear, No Rain in last 24h — Wes Khun
Temp in Mid 60's rising to 80° — Scott Maletyt
Dan Jones

0915 SW/SED-16 Approximately 50ft
Upstream of Lower in Creek.
Mid-Stream, Mostly Cobble, Gravel, Sand (Muddy)
3 Grabs composited in Mixing bowl

1000 ~~Sed 9/9/10~~ SW/SED-17 (Field Duplicate)
Collected Hand FD-1-100909
30 ft Downstream
of Beaver Dam, Mostly
Bedrock, Cobble, gravel, SAND
1 Grab by hand Could, but bedrock
Prevents Proper Sampling with Auger.
Used Stainless Steel Mixing Spoon
To collect SAND Gravel deposits
(Approx 4" deep).

Dan Jones
9-9-10

1105 SW/SED-18 MS/MSD
Collected at confluence of
UNNAMED Trib on Left bank.
SW immediately below Trib.
SED From confluence Banks, L and R

SED Mostly Sand & Gravel

1175 Depart for Lunch

1:00 On Site, Prep for Sampling
Matt G. - Reported for other Project
Randy Woodruff on Site

Dan Jones
9-9-10

D.S. Jones

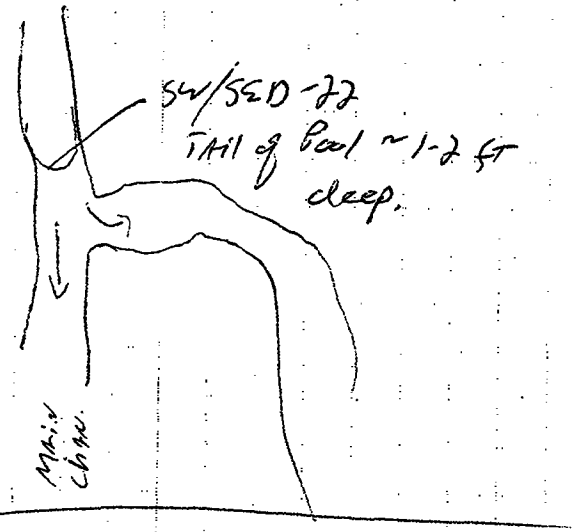
CSX Bloomington
SW/SED for ERA

9-9-10

1340 SW/SED-19 collected
Mid Stream just upstream of
bend. Mostly Sand, Gravel.
Water depths from ~4" to 10".
4 Grabs in Composite.

1415 SW/SED-20 collected
About 75 ft upstream of SW/SED-19
in Mid-Stream at Tail of Large Pool,
Water depth ~ 6"-12". Mostly Sand
+ Gravel. Underlain by bedrock (Less
than 6" deep). 4 Grabs in Composite.

1445 SW/SED-21 Location Estimated
based on Distance upstream from
~~SED-2~~ 9-9-10 SW/SED-06 b/c not
shown on map. GPS Location Taken
Collected ~~Left~~ West Side of Stream (Ascend)
in Sand bar. Mostly Sand + Gravel



9-9-10

CSX Bloomington
SW/SED for ERA

DS Jones

9-9-10

1515 SW/SED-22 collected
Near estimated location of SW/SED-08
Mid Stream ~30' upstream from
Fork/Trib (Right Side Ascend).
Mostly Sand + Gravel.
Fork is Mostly Dry Stream channel
of Similar Size to Main Channel.
Appears to Flow East then South
Parallel to developed Property to East.

9-9-10

OS JAMES

CSX Bloomington
SW/SED for ERA

9-9-10

1530 SW/SED-23 Collected Mid Stream over Concrete Liner using SS Mixing Spoon for SED. Mostly Sand, some Gravel. Multiple Grabs with Spoon from ~10-15 Sq of Liner.

SW Collected ~~About~~ @ 9-9-10 upstream of SED, but Still over Liner.

15:45 Pack Coolers, Complete C-O-Cs

Site Location	Bloomington, Indiana	Sample ID No.	SW-3	Date	10/22/2003		
Sampling Location	Clear Creek						
Weather	Sunny, 50°	Sampling Time:	Begin 16:10	End	16:25		

Field Parameters

Color	Clear, particulates
Odor	Slight
Appearance	Sheening from bedrock
pH (s.u.)	7.98
Conductivity (mS/cm)	751.3
(µmhos/cm)	
Turbidity (NTU)	1.4
Temperature (°C)	17.52
Dissolved Oxygen (mg/L)	12.17
ORP (mV)	211

Remarks: Water quality meter not working working properly on 10-22-03, measurements taken on 11-03-03 at 15:10.

Constituents Sampled	Container Description	Number	Preservative
Alkylated PAHs (USEPA 8270C)	1 L amber	2	None
BTEX (USEPA 8021)	40 ml VOA vials	3	HCl
Total metals (USEPA 6000/7000/200.8)	1 L plastic	1	HNO_3
Dissolved metals (USEPA 6000/7000/200.8)	1 L plastic	1	$HN0_3$
Hardness (SM2340C/USEPA 130.2)	(1 L plastic)	(1)	($HN0_3$)

Sampling Personnel: T. Barber/K. Leigh/ T. Mattox

Threatened and Endangered Species Correspondence

DNR Indiana Department of Natural Resources

Frank O'Bannon, Governor
Larry D. Macklin, Director

Division of Nature Preserves
402 W. Washington St W267
Indianapolis, IN 46204-2748
PH: 317/232-4052
FAX: 317/233-0133

March 30, 1999

Ms. Nadine Weinberg
Arcadis Geraghty & Miller, Inc.
24 Preble Street, First Floor
Portland, ME 04101

Dear Ms. Weinberg:

I am responding to your request for information on the endangered, threatened, or rare (ETR) species, high quality natural communities, and natural areas documented within ½ mile of five project areas in Indiana. The Indiana Natural Heritage Data Center has been checked and following you will find information on the ETR species and significant areas documented from these areas.

1. 240 Country Club Drive, Bloomington, Monroe County: There are no ETR species nor significant areas documented from this project area.
2. Monon Rail Yard, Hammond, Lake County: There are no ETR species nor significant areas documented from this project area.
3. 133 Franklin Street, Aurora, Dearborn County: On the enclosed data sheet you will find information on the ETR species documented from this project area.
4. 600 West Canal Street, Peru, Miami County: On the enclosed data sheet you will find information on the ETR species documented in from this project area.
5. 419 North Green Street, Crawfordsville, Montgomery County: There are no ETR species nor significant areas documented from this project area.

For more information on the animal species mentioned, please contact Katie Smith, Nongame Supervisor, Division of Fish and Wildlife, 402 W. Washington Room W273, Indianapolis, Indiana 46204, (317)232-4080.

The information I am providing does not preclude the requirement for further consultation with the U.S. Fish and Wildlife Service as required under Section 7 of the Endangered Species Act of 1973. You should contact the Service at their Bloomington, Indiana office.

U.S. Fish and Wildlife Service
620 South Walker St.
Bloomington, Indiana 47403-2121
(812)334-4261

At some point, you may need to contact the Department of Natural Resources' Environmental Review Coordinator so that other divisions within the department have the opportunity to review your proposal.

An Equal Opportunity Employer

For more information, please contact:

Larry Macklin, Director
Department of Natural Resources
attn: Stephen H. Jose
Environmental Coordinator
Division of Fish and Wildlife
402 W. Washington Street, Room W273
Indianapolis, IN 46204
(317)232-4080

Please note that the Indiana Natural Heritage Data Center relies on the observations of many individuals for our data. In most cases, the information is not the result of comprehensive field surveys conducted at particular sites. Therefore, our statement that there are no documented significant natural features at a site should not be interpreted to mean that the site does not support special plants or animals.

Due to the dynamic nature and sensitivity of the data, this information should not be used for any project other than that for which it was originally intended. It may be necessary for you to request updated material from us in order to base your planning decisions on the most current information.

Thank you for contacting the Indiana Natural Heritage Data Center. You may reach me at (317)232-4052 if you have any questions or need additional information.

Sincerely,

Ronald P. Hellmich

May 13, 1999

Mr. Nadine Weinberg
Arcadis Geraghty & Miller, Inc.
24 Preble Street, First Floor
Portland, Maine 04101

Dear Ms. Weinberg:

This is in response to your letter dated March 29, 1999 requesting information regarding the potential occurrence of critical habitat and/or Federally endangered and threatened species for a 5 sites in Monroe, Lake, Dearborn, Miami, and Montgomery Counties in Indiana. The site locations are described below.

These comments have been prepared under the authority of the Fish and Wildlife Coordination Act (16 U.S.C. 661 et. seq.) and are consistent with the intent of the National Environmental Policy Act of 1969, the Endangered Species Act of 1973, and the U. S. Fish and Wildlife Service's Mitigation Policy.

Any Covenant Not To Sue (CNTS) for natural resource damages granted by the State of Indiana under its Voluntary Remediation Program (VRP) would not represent nor perhaps encompass the position of the federal natural resource trustees under Section 122(j) of the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA) as amended. This letter does not represent formal review of this project by the Department of the Interior (DOI) and therefore, this in no way should be construed to represent a position as to whether or not a CNTS for natural resource damages to federal trust resources would be appropriate.

THREATENED AND ENDANGERED SPECIES

240 County Club Drive, Bloomington, Monroe County, Indiana

This area described in your letter is within the range of the Federally endangered Indiana bat (*Myotis sodalis*) and the Federally threatened bald eagle (*Haliaeetus leucocephalus*). There are known nesting records, as well as wintering records for the eagle in Monroe County, specifically near Lake Lemon and Lake Monroe. The Indiana bat has a known hibernacula several miles west of Bloomington. Clear Creek may provide suitable summer habitat, although no surveys have been conducted for that area.

Monon Rail Yard, between 173rd Street and Interstates 80 and 94, Hammond, Lake County, Indiana

This area is within the range of the Indiana bat and bald eagle; however, there are no current records of either species for the county.

133 Franklin Street, Aurora, Dearborn County, Indiana

This site is within the range of the Indiana bat, bald eagle, and running buffalo clover (*Trifolium stoloniferum*); however, there have been no recent surveys done for any of the species in the county. Potential bat habitat may exist along Hogan Creek and the Ohio River. Also, bald eagles are known to nest and winter along the Ohio, further downstream. Running buffalo clover has been found just south of Laughery Creek in adjacent Ohio County.

600 West Canal Street, Peru, Miami County, Indiana

This area is within the range of the Indiana bat and bald eagle. There is no survey information for the Indiana bat in Miami County; however, both Wabash and Howard Counties have records. There is no survey information for the bald eagle in Miami County. There are records for the Wabash River of the fanshell mussel (*Cyprogenia stegaria*) in Wabash and Carroll Counties.

419 North Green Street, Crawfordsville, Montgomery County, Indiana

This area is within the range of the Indiana bat and the bald eagle. There are several records of the Indiana bat along Sugar Creek within the county. In addition, Sugar Creek (up to approximately the town of Alamo) is considered a primary wintering area for bald eagles. Shelly ditch and Sugar Creek in Crawfordsville may provide suitable Indiana bat foraging habitat.

SPECIES INFORMATION

The Indiana bat uses woodlands during the summer when maternity colonies utilize trees with loose bark for roosting. These bats forage primarily over wooded stream corridors, although they have been collected in grazed woodlots, mature deciduous forests, and pastures with trees.

Bald eagles nest in close proximity to lakes, rivers, or reservoirs. They construct their nests near habitat ecotones, such as lakeshores, rivers, and timber management areas (clearcuts or selective cuts). Tolerance of human activity during the nesting season has been variable, but, ideally, human disturbance of eagles should be avoided. The bald eagle's food base from the watershed includes carrion, waterfowl, and especially fish.

The fanshell is generally found in medium to large rivers in gravel riffles.

The running buffalo clover in Indiana is found in narrow, shallow, wooded stream valleys that had been grazed by cattle. These stream valleys are along intermittent tributaries to the Ohio River. The clover grows in small, scattered stands on loamy soils such as small stream terraces, or rarely on cobbles in the stream bed. The species is thought to be somewhat disturbance-dependent.

In the event that Federally listed species are found within the project area or determined to be adversely affected by project plans, further coordination may be required under the Endangered Species Act of 1973, as amended.

OTHER SPECIES OF CONCERN

In addition to the above mentioned species, several other state-listed species may be potentially found near the areas of interest, including, but not limited to the eastern woodrat (*Neotoma magister*) and Kirtland's snake (*Clonophis kirtlandii*) (both potentially found in Monroe County). These species are not afforded legal protection under the authorities of the Endangered Species Act (as amended); however, agencies are encourage to consider them during project planning becasue there is general concern amoung resource agencies regarding their status.

Contamination from these sites may migrate to nearby wetlands, waterways, or other areas of ecological significance. Pathways of migration may include leachate/ground water, surface water, and sediment. Under conditions that allow certain contaminants to accumulate in waterways, aquatic organisms can bioaccumulate these elements; consequently, elevated or toxic concentrations may be reached. We recommend that sampling and monitoring efforts address the potential for off-site migration of any possible contaminants.

The attached National Wetland Inventory (NWI) maps indicates that there are a variety of wetland habitat types near the areas of interest. Water and other habitat resources of wetlands are attractive to numerous wildlife species, including birds, bats, plants, small mammals and snakes. In particular, migratory birds such as wood ducks (*Aix sponsa*), mallards (*Anas platyrhynchos*), and tree swallows (*Tachycineta bicolor*) will utilize open-water wetlands and are subject to potential impacts from contaminants. We recommend that project plans be designed to avoid impacts to the wetland habitats, particularly regarding contamination.

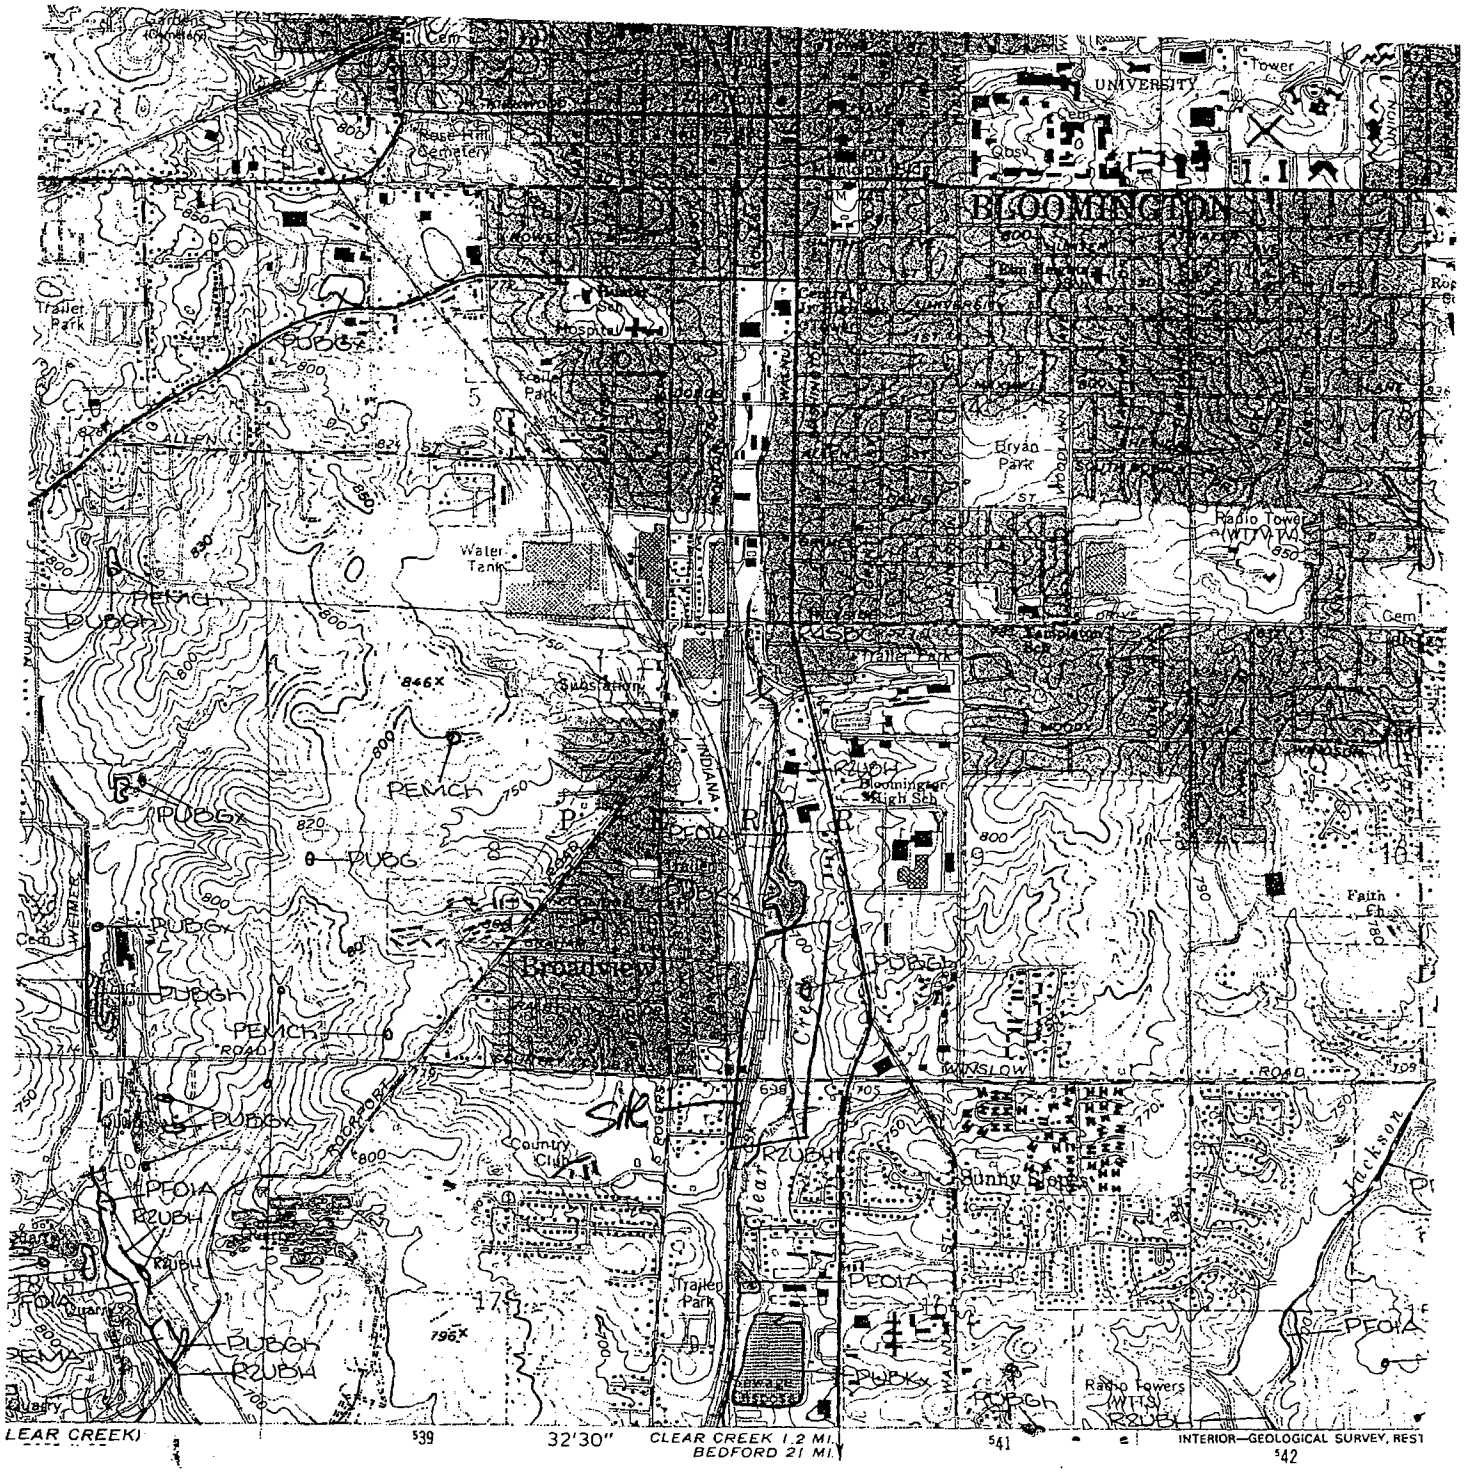
Based on the occurrence of wetlands adjacent to the most of the sites, certain activities may require a permit under Section 404 of the Clean Water Act. This process is administered by the U.S. Army Corps of Engineers. The appropriate Corps address will depend on the site location. Listed below are the two Corps' offices that cover Indiana:

U.S. Army Corps of Engineers
Louisville District
P.O. Box 59
Louisville, Kentucky 40201

U.S. Army Corps of Engineers
Detroit District
P.O. Box 1027
Detroit, Michigan 48231

This information does not include concerns for other wildlife resources. Therefore, we recommend that you also contact the Indiana Department of Natural Resources, Division of Nature Preserves, and Division of Fish and Wildlife concerning possible State-listed species and other resource concerns. Their addresses are:

Indiana Department of Natural Resources
Division of Nature Preserves
402 West Washington, Rm W267
Indianapolis, Indiana 46204



Indiana Department of Natural Resources
Division of Fish & Wildlife
402 West Washington, Rm W273
Indianapolis, Indiana 46204

We appreciate the opportunity to comment at this early stage of project planning. If we can be of further assistance please contact Robin McWilliams-Munson or Mike Litwin at (812) 334-4261 ext. 207 or ext. 205, respectively.

Sincerely,

Scott E. Pruitt
Acting Supervisor

Screening-Level Risk Evaluation of Wildlife

D. SCREENING-LEVEL RISK EVALUATION OF WILDLIFE

D.1 Introduction

This screening-level assessment evaluates the potential risks to aquatic-feeding wildlife associated with polycyclic aromatic hydrocarbons (PAHs) and selected metals (arsenic, cadmium, and nickel) in Clear Creek adjacent to the former Indiana Creosoting Company site. This assessment considers two representative wildlife species: raccoons (*Procyon lotor*) and belted kingfishers (*Ceryle alcyon*).

The raccoon has been reported to be the most abundant and widespread medium-sized omnivore in North America (U.S. EPA 1993). Raccoons also tend to be more closely associated with aquatic systems than most mammals, although they feed opportunistically from both aquatic and terrestrial sources. Exposure to chemicals of interest (COIs) is enhanced by raccoons' potential to ingest sediment that may be attached to invertebrate prey.

Belted kingfishers feed almost exclusively from the aquatic environment. Their exposure potential is enhanced by their small territory size and comparatively high food ingestion rate relative to their body weight. For these reasons, the assessment of risks to belted kingfishers is protective of other bird species that may feed from Clear Creek adjacent to the site.

D.2 Exposure Characterization for Wildlife

Wildlife exposures are evaluated in this assessment by calculating the average daily intake of each COI, generally based on the methodology described by the United States Environmental Protection Agency (U.S. EPA 1993) in the *Wildlife Exposure Factors Handbook*. Daily intake calculations are required because wildlife are exposed via multiple pathways, including diet, incidental sediment ingestion, and surface water ingestion. The following equation is used to calculate daily intakes:

$$DI = \frac{\left[\left(C_i \times F_i \times IR_f\right) + \left(C_w \times IR_w\right) + \left(C_s \times IR_s\right)\right] \times AF \times AUF}{BW}$$

where:

DI = daily intake, expressed in milligrams COI per kilogram body weight per day (mg/kg-day);
C_i = concentration of COI in aquatic biota (mg/kg);
F_i = fraction of diet as aquatic biota (unitless);
IR_f = food ingestion rate (kg/day);
C_w = concentration of COI in water (mg/L);
IR_w = water ingestion rate (L/day);
C_s = concentration of COI in sediment (mg/kg);

IR_s = sediment ingestion rate (kg/day);
AF = absorption factor (unitless);
AUF = area use factor (unitless); and
BW = body weight (kg).

The approaches used to identify appropriate values for these exposure parameters are described below, followed by the detailed exposure profiles for raccoons and belted kingfishers.

D.2.1 Exposure Point Concentrations

Wildlife exposure point concentrations estimated for the Clear Creek study area are shown in Table E-1. The typical concept of ecological exposure is that wildlife contacts impacted media on a periodic and random basis. Because of the nature of such contact, exposure to wildlife does not really occur at any one fixed point; rather, it occurs at a variety of points throughout the receptors' territories, with equal likelihood that any given point within the exposure unit will be the contact location on any given day. Therefore, arithmetic mean concentrations of each COI detected in sediment and surface water serve as the exposure point concentrations in the wildlife exposure assessment. The use of mean concentrations is appropriate, because birds and mammals are highly mobile and consume prey items containing varying levels of COIs.

For this screening-level evaluation, the exposure concentrations of COIs in aquatic biota were estimated from sediment COI concentrations using published biota-sediment accumulation factors (BSAFs). The COIs identified for this evaluation may occur in aquatic biota, but they do not biomagnify through the food web. Therefore, BSAFs for benthic invertebrates are used as a conservative surrogate for all aquatic biota. In actuality, PAHs occur at considerably lower concentrations in fish than in benthic invertebrates, because fish efficiently metabolize PAHs (Meador, Stein et al. 1995). Similarly, arsenic has been shown to exhibit biodiminution in food chain exposures (Suhendrayatna, Nakajima et al. 2002a,b). Thus, the BSAFs used here are expected to overestimate actual exposures for wildlife that consume fish.

The BSAF for PAHs was identified from Tracey and Hansen (1996). Tracey and Hansen (1996) analyzed an extensive compilation of BSAF values for 27 species from studies that met their specified criteria for data quality. They found that the central tendencies for BSAF values separated by chemical class into PAHs, polychlorinated biphenyls (PCBs), and pesticides. Probability distributions for the three chemical classes were developed, and specific BSAF values were determined for various probability percentiles. For this assessment, the 50th probability percentile BSAF (median) was selected. Uncertainty associated with choosing the 50th probability percentile is addressed in Section E.5. The BSAFs identified by Tracey and Hansen (1996) for organic compounds are normalized based on the organic carbon content of sediment and the lipid content of biota. Therefore, COI concentrations in aquatic biota are derived from the following formula:

$$C_i = (C_s \div \%TOC) \times BSAF \times (\%lipid \times DW:WW)$$

where:

TOC = total organic carbon; and
DW:WW = dry weight to wet weight ratio conversion factor (unitless).

A value of 5 percent lipid content per dry weight for invertebrates was used in this evaluation (Boese and Lee 1992). This value was then multiplied by a dry weight to wet weight (DW:WW) conversion factor of 0.2 (assuming 80 percent water mass for aquatic organisms) resulting in a value of 1 percent lipids per wet weight of invertebrates.

For metals, BSAFs were identified from the analysis of Bechtel Jacobs (1998), conducted for the Oak Ridge National Laboratory. Bechtel Jacobs (1998) compiled an extensive set of BSAFs for metals and PCBs. The BSAFs for metals were segregated based on whether or not the invertebrate specimens were depurated (that is, allowed to clear their gut contents) prior to analysis. The BSAFs were then evaluated using simple summary statistics, as well as regression analyses testing whether bioaccumulation rates are dependent on sediment concentrations. A separate validation data set was used to determine which of these derivation methods was most appropriate for each metal. For this SLERA, arsenic is assessed using the median BSAF for non-depurated organisms, cadmium is assessed using the median BSAF for depurated organisms, and nickel is assessed using the central tendency regression for depurated organisms. Uncertainty associated with the use of central tendency BSAF estimates is discussed in Section E.5.

In contrast to hydrophobic organic compounds, metals do not partition preferentially to organic carbon and lipid. The BSAFs identified for metals by Bechtel Jacobs (1998) require adjustment only to convert estimated biota concentrations from a dry-weight basis to a wet-weight basis, as follows:

$$C_i = C_s \times BSAF \times DW:WW$$

As described above, a dry-weight to wet-weight conversion factor of 0.2 is used, assuming that aquatic organisms contain 80 percent moisture.

D.2.2 Ingestion Rates

The food ingestion rate for belted kingfishers is estimated based on information provided by the U.S. EPA (1993). A food ingestion rate is not listed in U.S. EPA (1993) for raccoons; therefore a food ingestion rate is calculated based on the raccoon's metabolic rate and the metabolic energy provided by their prey, as described in U.S. EPA (1993) and as shown in the following equations:

$$IR_f = NIR_{total} \times BW \times 0.001$$

where:

NIR_{total} = total normalized ingestion rate (g/kg-day); and

$$NIR_{total} = \frac{NFMR}{\sum (P_k \times ME_k)}$$

where:

NFMR = normalized free-living metabolic rate of predator (kcal/kg-day);
P_k = proportion of diet of k^{th} prey item (unitless);
ME_k = metabolic energy of k^{th} prey item (kcal/g wet weight); and

$$ME = GE \times AE$$

where:

GE = gross energy (kcal/g wet weight); and
AE = assimilation efficiency (unitless).

The raccoon's feeding strategy promotes the incidental ingestion of surface water and sediment. U.S. EPA (1993) cites data from Beyer on sediment ingestion rates, which were unpublished at the time U.S. EPA released its 1993 guidance but were subsequently published by Beyer, Connor et al. (1994). For this evaluation, sediment ingestion rates are obtained from Beyer, Connor et al. (1994). Beyer, Connor et al. (1994) present rates of sediment ingestion as a percentage of ingested food, on a dry weight basis. For this evaluation, COI concentrations and ingestion rates for sediment are presented on a dry weight basis, but for wildlife food items these parameters are presented on a wet weight basis. Therefore, for the purpose of calculating a sediment ingestion rate, the food ingestion rate described above is multiplied by a wet to dry weight conversion factor of 0.2 prior to applying the sediment intake rates developed by Beyer, Connor et al. (1994). Sediment ingestion by kingfishers is considered negligible, based on their feeding strategy (that is, capture of swimming fish).

D.2.3 Other Exposure Parameters

A conservative default value of 1 is employed as the absorption factor. This assumption may overestimate exposures, as laboratory toxicity tests often use highly available forms of the test chemical, whereas COIs in environmental media may be less bioavailable. Area use factors are applied when the foraging area of a wildlife receptor is larger than the area being assessed. Area use factors are identified by comparing the extent of available habitat in the study area with the home range or territory size of the wildlife ROI. Finally, dietary preferences and body weights for wildlife species are estimated based on information provided by U.S. EPA (1993).

D.2.4 Exposure Profile for Raccoons

Exposure of raccoons to COIs is evaluated by calculating daily intakes for dietary uptake, sediment ingestion, and surface water ingestion, as presented in Table E-2. The basis for the exposure parameter values applied in this SLERA is provided below.

- *Food ingestion rate* – Because U.S. EPA (1993) does not list a food ingestion rate for raccoons, it is necessary to derive a value based on the proportion of diet composed of fish, invertebrates, and terrestrial prey, the gross energy in each food group, the efficiency with which raccoons assimilate the gross energy in each food group, and the normalized free-living metabolic rate of raccoons. This derivation is presented in Table E-3.

- *Diet* – The raccoon has been reported to be an opportunistic omnivore, and the relative preference for plant and animal matter in the diet varies (U.S. EPA 1993). For this SLERA, dietary preferences are estimated based on a conservative synthesis of information reported by U.S. EPA (1993) from multiple studies. Exposure assumptions are based on the raccoon's dietary preferences in the spring (that is, breeding season). This approach is conservative, because raccoons consume a higher proportion of animal matter during the spring, and animal matter typically contains higher COI concentrations than plants. Raccoons typically consume few fish, with crayfish being the preferred food item from freshwater aquatic systems (U.S. EPA 1993). For this SLERA, the raccoon's diet is assumed to be comprised of 60 percent aquatic biota (for example, 50 percent benthic invertebrates and 10 percent fish or amphibians). The remainder of the diet is assumed to consist of terrestrial items (for example, terrestrial invertebrates, plants, garbage/carrion) that contain negligible concentrations of COIs.

- *Gross energy of fish, invertebrates, and terrestrial prey* – Gross energy calculations are based on the aquatic component of the raccoon's diet. A gross energy of 1.2 kcal/g wet weight is selected for fish, based on data on bony fishes reported by Thayer, Schaaf et al. (1973), as cited in U.S. EPA (1993). A gross energy of 1.2 kcal/g wet weight for terrestrial invertebrates (U.S. EPA 1993) is used as a surrogate to represent food obtained from the terrestrial environment. A gross energy of 0.95 kcal/g wet weight is selected for aquatic invertebrates, based on the mean of values reported in multiple studies reviewed by U.S. EPA (1993).

- *Assimilation efficiency* – Assimilation efficiency is calculated for the aquatic component of the raccoon's diet. An assimilation efficiency of 91 percent is selected for fish, based on U.S. EPA's (1993) calculated value for mammals consuming fish. A value of 87 percent is used for invertebrates, based on U.S. EPA's (1993) value selected from multiple studies for small mammals consuming insects. This value is used as the assimilation efficiency for both aquatic invertebrates and terrestrial prey.

- *Normalized free-living metabolic rate* – The selected value of 185 kcal/kg-day represents the mean of estimated values for free-living adult male and female raccoons, as reported by U.S. EPA (1993).

- *Sediment ingestion rate* –It is assumed that the rates of sediment ingestion by raccoons are equal to the rates reported by Beyer, Connor et al. (1994) for soil plus sediment. A sediment ingestion rate of 0.021 kg/day corresponds to Beyer, Connor et al.'s (1994) estimate that soil and sediment in diet of raccoons is 9.4 percent of the food ingestion rate, on a dry weight basis.

- *Water ingestion rate* – The water ingestion rate of 0.083 g/g-day used in this SLERA is equal to the mean of estimated values reported by U.S. EPA (1993) for adult male and female raccoons.

- *Body weight* – The body weight of 5.8 kg used in this SLERA is equal to the mean of adult male and female raccoon body weights reported in multiple studies cited by U.S. EPA (1993).

- *Area use factor* – Raccoons commonly utilize a home range of a few hundred hectares (U.S. EPA 1993), much larger than the study area for this SLERA. By comparison, if one assumes a 100 meter corridor along the 0.5 kilometers of stream adjacent to the site, the available habitat in the area of interest is only 5 hectares. A very conservative area use factor of 0.25 is used for raccoons in this SLERA.

D.2.5 Exposure Profile for Belted Kingfishers

Exposure of belted kingfishers to COIs is evaluated in this SLERA by calculating daily intakes for dietary uptake and surface water ingestion, as presented in Table E-4. The basis for the selected exposure factor values is described below.

- *Food ingestion rate* – 0.5 g/g-day is equal to the mean values reported for adult male and female kingfishers by Alexander (1977), as cited in U.S. EPA (1993).

- *Diet* – Belted kingfishers feed primarily on fish, with the remainder of the diet consisting of benthic invertebrates (for example, crayfish, insects), amphibians, birds, and mammals. For this SLERA, the kingfisher's diet is assumed to consist entirely of aquatic biota.

- *Water ingestion rate* – 0.11 g/g-day water ingestion represents the mean of calculated values for male and female belted kingfishers (U.S. EPA 1993).

- *Body weight* – 0.15 kg body weight is equal to the mean of values reported for adult male and female belted kingfishers in three studies cited by U.S. EPA (1993).

- *Area use factor* – During the breeding season, belted kingfisher pairs utilize a territory occupying approximately 1 to 2 kilometers of shoreline (U.S. EPA 1993). However, kingfishers maintain individual territories outside the breeding season which may encompass less than 0.5 kilometers of shoreline (U.S. EPA 1993). Therefore, an area use factor of 1.0 is assumed for this SLERA, under the very conservative assumption that the most exposed kingfishers feed exclusively within the study area.

D.3 Effects Characterization for Wildlife

Toxicity reference values (TRVs) are the measures of effects used to evaluate responses of wildlife receptors to the COIs. Methods used to derive TRVs are described below, followed by chemical-specific effects profiles.

D.3.1 Toxicity Reference Value Derivation

A variety of approaches are available for deriving TRVs, including regression analyses, toxicity testing, application of extrapolation and uncertainty factors, probabilistic analyses, and others. For this evaluation, a majority of the TRVs were obtained from the USEPA Ecological Soil Screening Level (EcoSSL) Guidance documents. The data used in the determining the TRVs in the EcoSSL guidance has undergone rigorous

scientific review as outlined in the USEPA Guidance for Developing Ecological Soil Screening Levels (USEPA 2005) and therefore are considered current and appropriate for this evaluation. The TRVs are typically reported as NOAELs and LOAELs for the laboratory species upon which testing was conducted, under defined testing conditions. In addition, extrapolation factors (EFs) and uncertainty factors (UFs) are used to derive TRVs for wildlife from laboratory study results, based on the methodology of Sample, Opresko et al. (1996) and Sample and Arenal (1999). This process involves the determination of a test species dose for a critical endpoint from a particular experimental combination of exposure concentration, exposure duration, test species, and COI. Uncertainty factors associated with the duration of exposure and endpoint measured are implemented as recommended for each TRV by Sample, Opresko et al. (1996).

The TRVs used in this evaluation are shown in Tables E-5 and E-6. TRVs are calculated in this evaluation according to the following equation:

$$TRV = \frac{Test\ Species\ Dose \times Body\ Weight\ EF}{Endpoint\ UF}$$

The test species dose is the dose reported in the toxicity study selected as the basis for each chemical-specific TRV. Test species doses are identified from USEPA (2005a,b; 2007a,b) and other published sources. An endpoint UF of 10 is used to estimate a no-effect dose (no observed adverse effect level or NOAEL) if only a lowest observed adverse effect level (LOAEL) is available. The body weight EF accounts for differences in species sensitivity based on the body sizes of test species and wildlife receptor species, as described below.

Sample and Arenal (1999) developed body weight scaling methods for numerous chemicals, based on an extensive compilation of toxicity data for multiple birds and mammals. Dosimetric differences between the test species and wildlife receptors are accounted for using:

$$NOAEL_w = NOAEL_t \times \left(\frac{BW_t}{BW_w} \right)^{1-b}$$

where:

$NOAEL_w$ = NOAEL for the wildlife ROI (mg/kg-day);
$NOAEL_t$ = NOAEL for the test species (mg/kg-day);
BW_t = test species body weight (kg);
BW_w = wildlife receptor body weight (kg); and
b = chemical-specific allometric scaling factor (unitless).

In cases where a chemical-specific allometric scaling factor is not available, the average scaling factor identified by Sample and Arenal (1999) is used (that is, 1.2 for birds or 0.94 for mammals).

In some instances, the TRV established in the EcoSSL guidance document is based on a geometric mean of the NOAEL values for reproductive and growth. This value was lower than the lowest bounded LOAEL for reproduction, growth, or survival (USEPA 2007a). In these instances where several different species were used to determine the

TRV, the test species body weight was set equal to the receptor body weight, in essence negating the body weight EF (i.e., setting EF equal to 1).

D.3.2 Toxicity of PAHs to Wildlife

D.3.2.1 Toxicity of PAHs to Mammals

For purposes of this assessment, TRVs are developed for total low molecular weight PAHs (LPAHs) and total high molecular weight PAHs (HPAHs), rather than for each measured PAH compound. The distinction between LPAHs and HPAHs is useful because these groups of PAHs exhibit different degrees of toxicity to wildlife. LPAHs are 2- and 3-ring PAHs, including acenaphthene, acenaphthylene, anthracene, fluorene, naphthalene, phenanthrene, and alkylated homologues of these PAHs. HPAHs are 4-, 5-, and 6-ring PAHs, including benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(e)pyrene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, perylene, pyrene, and alkylated homologues of these PAHs. Mammalian LPAH and HPAH TRVs are available from the USEPA EcoSSL guidance (USEPA 2007b). Conservative surrogate values based on data for certain individual PAHs are identified as mammalian test species doses for total LPAHs and total HPAHs. These values are intentionally conservative and are expected to significantly overestimate risks. A more refined assessment approach could be developed if the conservative TRVs for total LPAHs or HPAHs are exceeded; however, this effort is not necessary for this SLERA, as the conservative TRVs are not exceeded (Section E.4).

As provided in USEPA (2007b), the mammalian NOAEL test species dose for total LPAHs is 65.6 mg/kg-day; the NOAEL test species does for total HPAHs is 0.615 mg/kg-day.

D.3.2.2 Toxicity of PAHs to Birds

Relatively limited information is available on the effects of PAHs in birds. Schafer, Bowles et al. (1983) reported mortality in red-winged blackbirds and house sparrows following 18 hours of oral exposure to acenaphthene, anthracene, fluorene, and phenanthrene. Peakall, Hallett et al. (1982) reported a NOAEL of 200 mg crude oil per kg body weight for effects to body weight gain and organ weights in herring gulls treated with a single oral dose of crude oil mixed with corn oil. The same study (Peakall, Hallett et al. 1982) also reported a NOAEL of 2,000 mg crude oil per kg body weight (highest dose tested) for mortality. A study by Patton and Dieter (1980) reported mortality in mallards exposed for 7 months to a PAH mixture in food; the test species chronic NOAEL of 277 mg/kg-day was developed from the dietary no observed adverse effect concentration (NOAEC) of 4,000 mg/kg PAHs in feed. This value was used in this SLERA to assess exposures of birds to total LPAHs and total HPAHs.

D.3.3 Toxicity of Arsenic to Wildlife

Mammalian and avian arsenic TRVs are available from the USEPA EcoSSL guidance (USEPA 2005a). The mammalian NOAEL dose used in this evaluation is 1.04 mg/kg-day which is the highest bounded NOAEL below the lowest bounded LOAEL for

reproduction, growth or survival. The avian NOAEL dose is 2.24 mg/kg-day which is the lowest NOAEL value for reproduction, growth or survival..

D.3.4 Toxicity of Cadmium to Wildlife

Mammalian and avian cadmium TRVs are available from the USEPA EcoSSL guidance (USEPA 2005b). The mammalian NOAEL dose used in this evaluation is 0.77 mg/kg-day which is the highest bounded NOAEL below the lowest bounded LOAEL for reproduction, growth or survival. The avian NOAEL dose is 1.47 mg/kg-day which is the geometric mean of the NOAEL values for reproduction and growth..

D.3.5 Toxicity of Nickel to Wildlife

Mammalian and avian nickel TRVs are available from the USEPA EcoSSL guidance (USEPA 2007a). The mammalian NOAEL dose used in this evaluation is 1.70 mg/kg-day which is the highest bounded NOAEL below the lowest bounded LOAEL for reproduction, growth or survival. The avian NOAEL dose is 6.71 mg/kg-day which is the geometric mean of the NOAEL values for reproduction and growth.E.4 Risk Characterization

To estimate ecological risks to raccoons and belted kingfishers, hazard quotients (HQs) are calculated for each COI. An HQ is the ratio of the measure of exposure (for example, measured concentration or modeled dose) to a literature-based TRV (with comparable units):

$$HQ = \frac{DI}{TRV}$$

where:

DI = daily intake (mg/kg-day); and
TRV = COI reference toxicity value (mg/kg-day).

If the NOAEL-based HQ is less than or equal to 1, then the predicted dose of the specific COI is at or below a dose that has been shown not to adversely affect chronic reproduction or mortality. An HQ less than 1 indicates that adverse effects due to the COI are unlikely. Although HQ values much greater than 1 can be assumed to describe risks that are more severe than those associated with
HQs that slightly exceed 1, HQ values should not be interpreted literally or as probabilities. For example, an HQ of 0.5 does not reflect a 50 percent probability of adverse effects and an HQ of 4 does not necessarily indicate adverse effects twice as bad as those associated with an HQ of 2. Given the paucity of data available on effects of chemical mixtures on wildlife, risks due to different classes of chemicals are not assumed to be additive.

Tables E-5 and E-6 show the HQs calculated for wildlife receptors in this SLERA. All HQs are below 1, indicating that wildlife are not at risk due to COI exposures in the study area.

D.5 Uncertainty Analysis

Uncertainty can be introduced at every step in the evaluation process, as information of varying quality is gathered from diverse sources in order to be integrated into a complex framework. The methodology used in this SLERA for wildlife relies on a combination of point estimate values, some of which are central tendency and some of which are conservative. The results are presented as point estimates of risk that fall at unknown percentiles within the full distributions of exposure and risk. Consequently, the degree of conservatism in the risk estimates cannot be known with certainty, but it is quite likely that actual risks are overstated (Hattis and Burmaster 1994). The uncertainty associated with key parameters is summarized below.

Central tendency estimates:

- *Exposure point concentrations:* The arithmetic mean of COI concentrations in each environmental medium is used in this screening assessment to represent average exposures. This is a central tendency estimate.

- *Ingestion rates:* The ingestion rates used in this evaluation are central tendency estimates.

- *Lipid levels:* Site-specific wet-weight lipid concentrations are not available. Wet-weight lipid concentrations were estimated from Boese and Lee (1992), using the value of 5 percent lipid (dry weight) for invertebrates. This assumption is assumed to represent a central tendency.

- *BSAF estimation:* Since measured tissue concentrations of COIs were unavailable, invertebrate concentrations were estimated from sediment concentrations using published BSAFs. There is uncertainty associated with mathematical extrapolation from known values. The BSAF values used in this evaluation represent a central tendency for benthic invertebrates. If BSAF values for the 90^{th} probability percentile are used, HQs increase three to seven-fold, depending on the chemical. Note that the central tendency BSAFs for benthic invertebrates are expected to significantly overestimate bioaccumulation in fish, for the COIs evaluated in this SLERA.

Conservative estimates:

- *Area use factors:* The area use factors employed in this evaluation are very conservative, leading to a potentially significant overestimation of risks.

- *Bioavailability:* The bioavailability of COIs in environmental media may be lower than in the exposure media employed in avian and mammalian toxicity tests, particularly for metals. This uncertainty will lead to an overestimation of potential risks.

- *Species sensitivity:* When multiple appropriate toxicity studies were available, the most conservative test species dose was selected for the evaluation. Thus, sensitivity is much more likely to be overestimated than underestimated. This

conservatism is further compounded for HPAHs by the use of benzo(a)pyrene, one of the most toxic PAHs, as a surrogate for all HPAHs.

In summary, the screening-level risk evaluation for wildlife uses a combination of central tendency and conservative estimates for the exposure and effects assessments. This approach likely results in an overestimation of potential risks to wildlife.

D.6 Conclusions

Risks to representative aquatic-feeding wildlife species have been assessed for the Clear Creek study area. The results of this analysis show that wildlife are not at risk due to PAHs, arsenic, cadmium, or nickel exposures.

Table D-1. Exposure Point Concentrations for Wildlife Receptors
Clear Creek, Bloomington, Indiana

	Sediment Concentration[a,b] Cs (mg/kg)	Water Concentration[a,b] Cw (mg/L)	Biota-Sediment Accumulation Factor[c]	Biota Tissue Concentration Cb (mg/kg)
Total LPAHs	2.1	0.00022	0.29	0.71
Total HPAHs	9.2	0.00018	0.29	3.1
Arsenic	8.5	0.0014	0.025	0.22
Cadmium	0.87	0.00013	0.092	0.080
Nickel	20	0.0018	0.029	0.58

a. Based on arithmetic mean concentrations, assuming one-half the detection limit for non-detects.
b. Metals concentrations are based on total metals results.
c. Biota-sediment accumulation factors are adjusted to estimate wet-weight tissue concentrations from dry-weight sediment concentrations, based on the average site-specific organic carbon content of sediment and assuming biota contain 5 percent lipid and 80 percent moisture.

HPAHs - high molecular weight PAHs
LPAHs - low molecular weight PAHs
mg/kg - milligrams per kilogram
mg/L - milligrams per liter
PAHs - polycyclic aromatic hydrocarbons
