1. INTRODUCTION

Ramboll US Consulting, Inc. (Ramboll) has prepared this Remedial Progress Report (Report) for the RCO-Reed Corporation d/b/a Reed Manufacturing Services (Reed) facility located at 1056 Eastview Drive in Franklin, Johnson County, Indiana (Site). The Site is illustrated on **Figure 1**. The Indiana Department of Environmental Management (IDEM) State Cleanup identification number for the Site is 2013-42015.

This Report follows the *Source Area Remediation Report*, dated April 24, 2020, which documented the remediation of an apparent source area on the far southeast portion of the Site property and on the adjacent Hurricane Road Industrial Development (HRID) property (IDEM Site #2013-34567). This Report also follows a *Remedial Progress Report*, dated September 15, 2020, which documented the first post-remediation groundwater sampling event. A summary of the Site remediation activities is provided in Section 2 below. To monitor the effectiveness of the source area remediation, Ramboll proposed quarterly monitoring of a subset of the on-Site and off-Site monitoring wells. In accordance with Section 5 of the *Source Area Remediation Report*, the sampling plan included sampling on-Site wells MW-3, MW-5, and MW-7 and off-Site wells MW-11, MW-23, MW-30, and MW-31. The second and third post-remediation sampling events conducted in September and December 2020, respectively, are documented in Sections 3 and 4 below.

2. COMPLETED REMEDIATION

The following section provides a summary of the source area remediation activities conducted in February and March 2020. The remediation included soil excavation and application of a groundwater treatment via an infiltration gallery installed at the bottom of the excavation. The footprint of the remediation area is included on **Figure 1**.

2.1 Excavation

The soil excavation area was identified based on existing soil analytical data and ended up being approximately 5,200 square feet in area located in the southeastern portion of the Site property and onto the adjacent HRID property. The excavation occurred between February 12-19, 2020 and generally followed the sloping topography, extending to approximately 13 feet below ground surface (bgs) in the northern portion of the excavation and to approximately 8 feet bgs in the southern portion. The total depth of the excavation extended to the water table. Approximately 2,500 tons of non-hazardous soil and debris were removed and disposed of at a properly permitted facility. Confirmation samples were collected from the bottom of the excavation and along sidewalls in accordance with IDEM guidance. All confirmation sample results were below the established remedial target concentration of 1 part per million (ppm) for tetrachloroethene (PCE) and trichloroethene (TCE). The excavation was backfilled between February 24 and 27, after installation of the infiltration gallery as discussed below.

2.2 Groundwater Treatment

The November 25, 2019 IDEM letter approving the *Source Area Remedial Plan* recommended applying a groundwater treatment product during the excavation. After the soil excavation was completed and prior to backfilling, an infiltration gallery constructed of

4-inch diameter perforated polyvinyl chloride (PVC) was placed in the bottom of the excavation and brought to grade with a riser pipe. Five lines were installed generally perpendicular to groundwater flow. Following construction of the infiltration gallery, the excavation was backfilled with a generally coarse-grained pit run soil and compacted with a skid steer. On March 3-5, 2020, a solution of approximately 7,025 gallons of water mixed with 3,097 pounds of potassium permanganate was injected into the infiltration gallery for dispersion into the saturated zone below the excavated area.

3. GROUNDWATER MONITORING

The following sections describe the groundwater monitoring methodology, groundwater flow trends, and the analytical results from the September 24-25 and December 3-4, 2020 monitoring events.

3.1 Methodology

Ramboll completed monitoring well sampling activities on September 24-25 and on December 3-4, 2020 using low-flow purge techniques. All on-Site monitoring wells were gauged, and a subset of the Site monitoring wells and four wells on the adjacent HRID site were sampled to evaluate the effectiveness of the excavation and groundwater remediation over time. Specifically, the monitoring wells sampled included on-Site wells MW-3, MW-5, and MW-7, and off-site wells MW-11, MW-23, MW-30, and MW-31. Monitoring well MW-7 was not sampled during the September 24-25 event due to the well being dry. On December 3, 2020, MW-7 had to be sampled using a disposable bailer due to a limited amount of groundwater in the well.

Prior to sampling for each event, all monitoring wells were gauged with an electronic water level indicator. Monitoring wells were purged using United States Environmental Protection Agency (USEPA) low flow procedures and immediately sampled thereafter using a QED Sample Pro Bladder Pump and new disposable low-density polyethylene tubing. During the purge process, water quality parameters including pH, temperature, dissolved oxygen (DO), oxidation-reduction potential (ORP), specific conductivity, and turbidity were monitored and recorded. Of note, the specific conductivity probe used for the off-Site wells on December 4 appeared to have malfunctioned. Following the stabilization of groundwater quality field parameters, groundwater samples were collected into laboratory-provided sample containers and packed on ice for delivery to the Pace Analytical Laboratory in Indianapolis, Indiana (Pace). A HACH manganese high range pocket colorimeter II field kit was used to evaluate the presence of residual permanganate in the groundwater. Groundwater sampling field data forms are provided in **Appendix A**.

Groundwater and quality assurance and quality control (QA/QC) samples were submitted under proper chain of custody to Pace for analysis of volatile organic compounds (VOCs) by EPA Method 8260C. Groundwater monitoring samples were reported with Level II data quality objective (DQO).

All purge water and decontamination water were containerized on-Site, pending disposal. A request for “contained-in” determination was submitted to IDEM, and IDEM provided the “Contained-In” Determination for contaminated groundwater on December 28, 2020. The purge water waste is planned to be disposed of at an off-Site disposal facility in accordance with State and Federal regulations.

3.2 QA/QC Measures

QA/QC samples were collected in accordance with USEPA protocols for Level IV data, as described in USEPA's DQO for Remedial Response Activities, Volumes I and II (USEPA, 1987), and per IDEM's Minimum Data Reporting Requirements. Specifically,

- A field duplicate sample was collected with MW-11 during the September 2020 event, and with MW-30 during the December 2020 event,
- A trip blank was maintained with the groundwater samples during each event,
- An equipment blank was collected during each event, and
- Laboratory method blanks, matrix spikes, matrix spike replicates, surrogate spikes, analytical replicates, and laboratory replicates were analyzed at the laboratory to evaluate bias due to samples preparation and analysis, equipment performance and precision, and analytical bias and precision.

Field documentation included sample collection records, quality control records, general field procedures, and corrective action reports for any deviations from the standard field procedures and practices. Field documentation was recorded in the field notebook on a daily basis. Laboratory documentation includes chain-of-custody forms, management records, test methods, laboratory data sheets, internal QA/QC documentation, and documentation of regular equipment maintenance and calibration.

3.3 Groundwater Flow

Table 1 summarizes all groundwater elevation data collected at the Site. The potentiometric surface maps from the September 25 and December 4, 2020 gauging events are included as **Figure 2** and **Figure 3**, respectively. Groundwater flow continues to be in a general easterly to southeasterly direction in September and December 2020, which is consistent with prior monitoring events. The September and December 2020 groundwater elevations were on average 1.86 feet lower than the prior gauging event in June 2020. In general, the water table during the September and December 2020 monitoring events was lower than all past events, dating back to October 2014.

3.4 Groundwater Analytical Results

The September and December 2020 groundwater sampling analytical results are summarized in **Table 2** and **Figure 3**, and the laboratory reports are included in **Appendix B**. Groundwater analytical results from all monitoring well sampling events to date from the subset of wells, as well as available data from the adjacent HRID site are included in **Table 2** and on **Figure 3**.

With the exception of MW-30, PCE and TCE concentrations were generally consistent with previous sampling events and appear to be decreasing. In September and December 2020, there were no detections above the laboratory reporting limit in the on-site shallow well MW-3 and the off-site deep well MW-31. PCE and TCE concentrations slightly decreased at on-Site wells MW-5 and MW-7 between June and December 2020, as well as at MW-11 off-Site. Off-site well MW-23 shows a notable decrease of PCE and TCE concentrations since the June 2020 sampling event. At the off-site shallow well MW-30, chlorinated VOC concentrations were significantly lower in the September 2020 sampling event than in the prior June 2020 sampling event. In the December 2020 sampling event, the chlorinated VOC concentrations at MW-30 increased back to similar levels as the June 2020 sampling event. The highest concentrations of PCE and TCE from the on-Site monitoring wells in September and December 2020 were 27.9 micrograms per liter ($\mu\text{g}/\text{L}$) and 39.3 $\mu\text{g}/\text{L}$ respectively, at MW-7. The highest concentration of PCE and TCE from the

**Remedial Progress Report
Reed Manufacturing Services – Franklin, IN
State Cleanup Site # 2013-42015**

off-Site monitoring wells was 643 µg/L and 235 µg/L respectively, at MW-30 in December. No other VOCs were detected above the laboratory reporting limit in the monitoring wells sampled.

Per the April 24, 2020 *Source Area Remediation Report*, the proposed remedial goal is for PCE and TCE concentrations to meet the IDEM RCG commercial vapor exposure screening level (CVESL) at off-Site monitoring wells MW-11 and MW-30, which are located downgradient from the remediation area. In September 2020, only TCE exceeded the CVESL at MW-11, and concentrations of PCE and TCE were below the CVESL at MW-30. In December 2020, PCE and TCE exceeded the CVESL at MW-30, and TCE slightly exceeded the CVESL at MW-11.

Figure 5 depicts the PCE and TCE concentrations at select wells in relation to groundwater elevations. Based on the available data, it is unclear if PCE and TCE concentration trends are related to fluctuations in groundwater elevations, especially at MW-30. Additional monitoring data may determine whether a relationship exists and if there are any seasonal trends.

Table 3 summarizes the stabilized field parameter data, as well as the field manganese data. Groundwater field parameters are generally consistent amongst the shallow monitoring wells. In the September 2020 sampling event, shallow wells MW-5 and MW-11 had slightly lower DO than the other shallow monitoring wells. In the December 2020 sampling event, monitoring wells MW-3, MW-11, MW-23, MW-30, and MW-31 all had significantly lower dissolved oxygen than previous sampling events. ORP levels continue to be positive in the shallow wells and negative in deep well MW-31. Ph and specific conductivity have been generally consistent at the Site.

From September through December 2020, the manganese results showed a continued reduction in concentrations when compared to the June 2020 sampling event. In September 2020, manganese concentrations ranged from 0.0 mg/L at MW-5 to 2.4 mg/L at MW-23. In December 2020, there were no detectable concentrations of manganese in the wells analyzed.

4. CONCLUSION

This Report documents the second and third groundwater monitoring events following the completed source area remedial activities at the Site and extending onto the adjacent HRID property. With the exception of off-Site well MW-30, the PCE and TCE concentrations appear to be decreasing. At MW-30, PCE and TCE decreased significantly in September 2020, then increased in December 2020 to concentrations similar to those in June 2020. Both PCE and TCE were below the CVESL at MW-30 in September 2020, but exceeded the CVESL in the December 2020 sampling event. No chlorinated VOCs were detected at MW-31, indicating that deeper groundwater impacts have not occurred in this area. TCE continues to slightly exceed the CVESL at off-Site well MW-11. Of note, the water table was historically low during the September and December 2020 monitoring events.

Additional quarterly sampling events will help determine the effectiveness of the remedy as well as any seasonal fluctuations. The results from the next quarterly monitoring event

will help determine if an additional groundwater treatment is necessary. The upcoming First Quarter 2021 groundwater sampling event will be conducted in a similar manner as the September and December 2020 events.

QUALIFIERS

Project: Reed Manufacturing
Pace Project No.: 50268403

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.
ND - Not Detected at or above adjusted reporting limit.
TNTC - Too Numerous To Count
J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.
MDL - Adjusted Method Detection Limit.
PQL - Practical Quantitation Limit.
RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.
S - Surrogate
1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.
Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.
LCS(D) - Laboratory Control Sample (Duplicate)
MS(D) - Matrix Spike (Duplicate)
DUP - Sample Duplicate
RPD - Relative Percent Difference
NC - Not Calculable.
SG - Silica Gel - Clean-Up
U - Indicates the compound was analyzed for, but not detected.
N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.
Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.
TNI - The NELAC Institute.

ANALYTE QUALIFIERS

- L1 Analyte recovery in the laboratory control sample (LCS) was above QC limits. Results for this analyte in associated samples may be biased high.
- M0 Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
- R1 RPD value was outside control limits.

QUALIFIERS

Project: Reed Manufacturing
Pace Project No.: 50274940

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.
ND - Not Detected at or above adjusted reporting limit.
TNTC - Too Numerous To Count
J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.
MDL - Adjusted Method Detection Limit.
PQL - Practical Quantitation Limit.
RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.
S - Surrogate
1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.
Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.
LCS(D) - Laboratory Control Sample (Duplicate)
MS(D) - Matrix Spike (Duplicate)
DUP - Sample Duplicate
RPD - Relative Percent Difference
NC - Not Calculable.
SG - Silica Gel - Clean-Up
U - Indicates the compound was analyzed for, but not detected.
N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.
Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.
TNI - The NELAC Institute.

ANALYTE QUALIFIERS

- L1 Analyte recovery in the laboratory control sample (LCS) was above QC limits. Results for this analyte in associated samples may be biased high.
- L2 Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.
- M0 Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
- M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
- R1 RPD value was outside control limits.
- S0 Surrogate recovery outside laboratory control limits.
- S3 Surrogate recovery exceeded laboratory control limits. Analyte presence below reporting limits in associated sample.
