1. INTRODUCTION

Ramboll US Consulting, Inc. (Ramboll) has prepared this Remedial Progress Report (Report) for the RCO-Reed Corporation d/b/a Reed Manufacturing Services (Reed) facility located at 1056 Eastview Drive in Franklin, Johnson County, Indiana (Site). The Site is illustrated on **Figure 1**. The Indiana Department of Environmental Management (IDEM) State Cleanup identification number for the Site is 2013-42015.

This Report follows the *Source Area Remediation Report*, dated April 24, 2020, which documented the remediation of an apparent source area on the far southeast portion of the Site property and on the adjacent Hurricane Road Industrial Development (HRID) property (IDEM Site #2013-34567). This Report also follows two Remedial Progress Reports, dated September 15, 2020 and January 22, 2021, which together documented the first three post-remediation groundwater monitoring events. IDEM provided a review letter to the January 22, 2021 Remedial Progress Report on March 30, 2021. The IDEM letter agreed with the planned additional monitoring to evaluate the remedy effectiveness, and that plume behavior monitoring can be considered.

A summary of the Site remediation activities is provided in Section 2 below. To monitor the effectiveness of the source area remediation, Ramboll proposed quarterly monitoring of a subset of the on-Site and off-Site monitoring wells. In accordance with Section 5 of the *Source Area Remediation Report*, the sampling plan included sampling on-Site wells MW-3, MW-5, and MW-7 and off-Site wells MW-11, MW-23, MW-30, and MW-31. The fourth post-remediation sampling event conducted in March 2021 is documented in Sections 3 and 4 below.

2. COMPLETED REMEDIATION

The following section provides a summary of the source area remediation activities conducted in February and March 2020. The remediation included soil excavation and application of a groundwater treatment via an infiltration gallery installed at the bottom of the excavation. The footprint of the remediation area is included on **Figure 1**.

2.1 Excavation

The soil excavation area was identified based on existing soil analytical data and ended up being approximately 5,200 square feet in area located in the southeastern portion of the Site property and onto the adjacent HRID property. The excavation occurred between February 12-19, 2020 and generally followed the sloping topography, extending to approximately 13 feet below ground surface (bgs) in the northern portion of the excavation and to approximately 8 feet bgs in the southern portion. The total depth of the excavation extended to the water table. Approximately 2,500 tons of non-hazardous soil and debris were removed and disposed of at a properly permitted facility. Confirmation samples were collected from the bottom of the excavation and along sidewalls in accordance with IDEM guidance. All confirmation sample results were below the established remedial target concentration of 1 part per million (ppm) for tetrachloroethene (PCE) and trichloroethene (TCE). The excavation was backfilled between February 24 and 27, 2020 after installation of the infiltration gallery as discussed below.

2.2 Groundwater Treatment

The November 25, 2019 IDEM letter approving the *Source Area Remedial Plan* recommended applying a groundwater treatment product during the excavation. After the soil excavation was completed and prior to backfilling, an infiltration gallery constructed of 4-inch diameter perforated polyvinyl chloride (PVC) was placed in the bottom of the excavation and brought to grade with a riser pipe. Five lines were installed generally perpendicular to groundwater flow. Following construction of the infiltration gallery, the excavation was backfilled with a generally coarse-grained pit run soil and compacted with a skid steer. On March 3-5, 2020, a solution of approximately 7,025 gallons of water mixed with 3,097 pounds of potassium permanganate was injected into the infiltration gallery for dispersion into the saturated zone below the excavated area.

3. GROUNDWATER MONITORING

The following sections describe the groundwater monitoring methodology, groundwater flow trends, and the analytical results from the March 4-5, 2021 monitoring event.

3.1 Methodology

Ramboll completed monitoring well sampling activities on March 4-5, 2021 using low-flow purge techniques. All on-Site monitoring wells were gauged, and a subset of the Site monitoring wells and four wells on the adjacent HRID site were sampled to evaluate the effectiveness of the excavation and groundwater remediation over time. Specifically, the monitoring wells sampled included on-Site wells MW-3, MW-5, and MW-7, and off-site wells MW-11, MW-23, MW-30, and MW-31.

Prior to sampling for each event, all monitoring wells were gauged with an electronic water level indicator. Monitoring wells were purged using United States Environmental Protection Agency (USEPA) low flow procedures and immediately sampled thereafter using a QED Sample Pro Bladder Pump and new disposable low-density polyethylene tubing. During the purge process, water quality parameters including pH, temperature, dissolved oxygen (DO), oxidation-reduction potential (ORP), specific conductivity, and turbidity were monitored and recorded. Following the stabilization of groundwater quality field parameters, groundwater samples were collected into laboratory-provided sample containers and packed on ice for delivery to the Pace Analytical Laboratory in Indianapolis, Indiana (Pace). On March 4, 2021, MW-7 had to be sampled using a disposable bailer due to a limited amount of groundwater in the well. One set of field parameter reading were collected from MW-7. A HACH manganese high range pocket colorimeter II field kit was used to evaluate the presence of residual permanganate in the groundwater. Groundwater sampling field data forms are provided in **Appendix A**.

Groundwater and quality assurance and quality control (QA/QC) samples were submitted under proper chain of custody to Pace for analysis of volatile organic compounds (VOCs) by EPA Method 8260. Groundwater monitoring samples were reported with Level II data quality objective (DQO).

All purge water and decontamination water were containerized on-Site, pending disposal. A request for “contained-in” determination was submitted to IDEM, and IDEM provided the “Contained-In” Determination for contaminated groundwater on December 28, 2020. The purge water waste is planned to be disposed of at an off-Site disposal facility in accordance with State and Federal regulations.

3.2 QA/QC Measures

QA/QC samples were collected in accordance with USEPA protocols for Level IV data, as described in USEPA's DQO for Remedial Response Activities, Volumes 1 and II (USEPA, 1987), and per IDEM's Minimum Data Reporting Requirements. Specifically,

- A field duplicate sample was collected with MW-30 during the March 2021 event,
- A trip blank was maintained with the groundwater samples,
- An equipment blank was collected, and
- Laboratory method blanks, matrix spikes, matrix spike replicates, surrogate spikes, analytical replicates, and laboratory replicates were analyzed at the laboratory to evaluate bias due to samples preparation and analysis, equipment performance and precision, and analytical bias and precision.

Field documentation included sample collection records, quality control records, general field procedures, and corrective action reports for any deviations from the standard field procedures and practices. Field documentation was recorded in the field notebook on a daily basis. Laboratory documentation includes chain-of-custody forms, management records, test methods, laboratory data sheets, internal QA/QC documentation, and documentation of regular equipment maintenance and calibration.

3.3 Groundwater Flow

Table 1 summarizes all groundwater elevation data collected at the Site. The potentiometric surface map from the March 5, 2021 gauging event is included as **Figure 2**. Groundwater flow continues to be in a general easterly to southeasterly direction in March 2021, which is consistent with prior monitoring events. The March 2021 groundwater elevations were on average approximately one foot higher than the prior gauging event in December 2020. In general, the water table during the March 2021 monitoring event was near the average for past events, dating back to October 2014.

3.4 Groundwater Analytical Results

The March 2021 groundwater sampling analytical results are summarized in **Table 2** and **Figure 3**, and the laboratory reports are included in **Appendix B**. Groundwater analytical results from all monitoring well sampling events to date from the subset of wells, as well as data from the adjacent HRID site are included in **Table 2** and on **Figure 3**.

With the exception of MW-30, PCE and TCE concentrations were generally consistent with previous sampling events and appear to be stable or decreasing. A trend is currently not discernable at MW-30. In March 2021, there were no detections above the laboratory reporting limit in the on-site shallow well MW-3 and the off-site deep well MW-31. PCE and TCE concentrations slightly increased at on-Site wells MW-5 and MW-7 between December 2020 and March 2021, as well as at MW-11 off-Site, but are within range of typical sample variability. Off-site well MW-23 had a slight decrease in PCE and TCE concentrations since the December 2020 sampling event. In the March 2021 sampling event, the PCE and TCE concentrations at MW-30 remained at similar levels as the June and December 2020 sampling events. A significant decrease in concentrations at MW-30 occurred in September 2020, which may have been an effect of the remedial activities; however, concentrations have since rebounded. Overall, the highest concentrations of PCE and TCE from the on-Site monitoring wells in March 2021 were 41.1 micrograms per liter ($\mu\text{g}/\text{L}$) and 56.7 $\mu\text{g}/\text{L}$ respectively, at MW-7. The highest concentration of PCE and TCE from the off-Site monitoring wells was 586 $\mu\text{g}/\text{L}$ and 271 $\mu\text{g}/\text{L}$ respectively, at MW-30. No

other VOCs were detected above the laboratory reporting limit in the monitoring wells sampled.

Per the April 24, 2020 *Source Area Remediation Report*, the proposed remedial goal is for PCE and TCE concentrations to meet the IDEM RCG commercial vapor exposure screening level (CVESL) at off-Site monitoring wells MW-11 and MW-30, which are located downgradient from the remediation area. In March 2021 PCE and TCE exceeded the CVESL at MW-30, and TCE slightly exceeded the CVESL at MW-11. A plume stability approach is being considered as the proposed remedial goal instead of meeting the CVESLs.

Figure 4 depicts the PCE and TCE concentrations at select wells in relation to groundwater elevations. Based on the available data, it still remains unclear if the PCE and TCE concentration trends are related to fluctuations in groundwater elevations, especially at MW-30. Additional monitoring data may determine whether a relationship exists and if there are any seasonal trends.

Table 3 summarizes the stabilized field parameter data, as well as the field manganese data. Groundwater field parameters are generally consistent amongst the shallow monitoring wells. In the March 2021 sampling event, all of the monitoring wells showed a slight increase in DO as compared to the December 2020 event, with the exception of MW-7 which had a significant increase likely as a result of collecting a grab groundwater reading due to low water volume. ORP levels continue to be positive in the shallow wells. ORP at deep well MW-31 was positive during the March 2021 sampling event, whereas it had previously been negative. Ph and specific conductivity have been generally consistent at the Site, although the specific conductivity value at MW-30 was notably higher in March 2021 compared to prior events. Manganese was not detected at off-Site wells MW-11, MW-30, and MW-31 during the March 2021 sampling event, while MW-3, MW-5, and MW-23 showed a slight increase in manganese detections ranging from 0.2 mg/L at MW-5 to 2.3 mg/L at MW-23. MW-7 showed a significant increase in manganese concentration (9.2 mg/L) compared to the last collected reading in June 2020 (1.0 mg/L). It is possible this increase was influenced by the sample being very turbid in March 2021.

4. CONCLUSION

This Report documents the fourth groundwater monitoring events following the completed source area remedial activities at the Site and extending onto the adjacent HRID property. With the exception of off-Site well MW-30, the PCE and TCE concentrations appear to be stable at MW-5, MW-7 and MW-11, and decreasing at MW-23. No trend in concentrations is apparent at MW-30. The only CVESL exceedance for PCE occurred at MW-30, and TCE exceeded the CVESL at MW-7, MW-11, MW-23, and MW-30. No chlorinated VOCs were detected at MW-31, indicating that deeper groundwater impacts have not occurred in this area.

Additional quarterly sampling events will help determine the effectiveness of the remedy as well as any seasonal fluctuations. Additional groundwater treatment is being considered, as well as using a plume stability approach as the proposed remedial goal instead of meeting the CVESLs. The upcoming Second Quarter 2021 groundwater sampling event will be conducted in a similar manner as the March 2021 event.

RE: Project: Reed Manufacturing
Pace Project No.: 50281533

Dear Mr. Goodwin:

Enclosed are the analytical results for sample(s) received by the laboratory on March 05, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Indianapolis

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

PROJECT NARRATIVE

Project: Reed Manufacturing
Pace Project No.: 50281533

Method: EPA 5030/8260
Description: 8260 MSV Indiana
Client: Ramboll US Consulting
Date: March 18, 2021

General Information:

10 samples were analyzed for EPA 5030/8260 by Pace Analytical Services Indianapolis. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):

All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:

All criteria were within method requirements with any exceptions noted below.

Internal Standards:

All internal standards were within QC limits with any exceptions noted below.

Surrogates:

All surrogates were within QC limits with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

QC Batch: 610755

L1: Analyte recovery in the laboratory control sample (LCS) was above QC limits. Results for this analyte in associated samples may be biased high.

- LCS (Lab ID: 2815042)
- Iodomethane

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 610524

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 50281577001

R1: RPD value was outside control limits.

- MSD (Lab ID: 2813918)
- Iodomethane

QC Batch: 610755

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 50281533007

M0: Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.

- MSD (Lab ID: 2815044)

QUALIFIERS

Project: Reed Manufacturing
Pace Project No.: 50281533

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.
ND - Not Detected at or above adjusted reporting limit.
TNTC - Too Numerous To Count
J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.
MDL - Adjusted Method Detection Limit.
PQL - Practical Quantitation Limit.
RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.
S - Surrogate
1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.
Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.
LCS(D) - Laboratory Control Sample (Duplicate)
MS(D) - Matrix Spike (Duplicate)
DUP - Sample Duplicate
RPD - Relative Percent Difference
NC - Not Calculable.
SG - Silica Gel - Clean-Up
U - Indicates the compound was analyzed for, but not detected.
N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.
Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.
TNI - The NELAC Institute.

ANALYTE QUALIFIERS

- L1 Analyte recovery in the laboratory control sample (LCS) was above QC limits. Results for this analyte in associated samples may be biased high.
- M0 Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
- R1 RPD value was outside control limits.
