APPENDIX E: IDEM's 305(b)/303(d) Monitoring, Assessment, Reporting and Listing Schedule
APPENDIX F: External Data Solicitation Letter
APPENDIX G: Trophic Status and Trends of Indiana's Lakes

EXECUTIVE SUMMARY

Section 305(b) of the federal Clean Water Act (CWA) requires states to prepare and submit a water quality assessment report of state water resources to the U.S. Environmental Protection Agency (USEPA) every two years. States are also required to develop and submit a list of impaired waters to USEPA for approval under CWA Section 303(d).

In 2002, USEPA encouraged states to combine the information that was previously submitted as two separate reports (the 305(b) report and 303(d) list), into one Integrated Water Monitoring and Assessment Report (IR) following the two-year schedule mandated in CWA section 305(b).

The Indiana Department of Environmental Management (IDEM), Office of Water Quality (OWQ) began using the integrated reporting format in 2002. This format calls for the development of two lists, both of which are included in this report. Indiana's Consolidated List contains assessment information for all waters of the state, which is developed to fulfill CWA Section 305(b) requirements. The 303(d) List of Impaired Waters is a subset of the Consolidated List and identifies only those waters that are impaired and for which a TMDL is required per CWA Section 303(d). In accordance with USEPA guidance, the IR also contains information on trends and trophic state of Indiana's lakes pursuant to CWA Section 314.

On September 26, 2007, the state's draft 2008 303(d) List of Impaired Waters was published in the Indiana Register for the 90-day public comment period required by Indiana law. In response to requests from the public, IDEM held two additional public meetings and extended the public comment period to January 31, 2008, to provide interested stakeholders additional time to submit their comments on the draft list. The IR includes only assessments conducted prior to September 26, 2007, in order to achieve consistency between the assessments reported in IDEM's Consolidated List and its 303(d) List of Impaired Waters. This approach allows Indiana to meet USEPA's reporting deadlines and minimizes inconsistencies in the information reported to USEPA and the public under different sections of the CWA.

IDEM OWQ prepared the 2008 IR following the guidelines provided by USEPA (1997a and 2005). This report for 2008 represents Indiana's fourth integrated water monitoring and assessment report and is intended to meet the reporting requirements of Sections 305(b), 303(d) and 314 of the CWA.

IDEM used data it collected and data collected by other organizations to develop this report. IDEM's solicitation, review and use of external data is described in detail in the section of this report entitled, Assessment Methodology and Summary Data. IDEM data used to develop this report was collected in accordance with IDEM's Surface Water Quality Monitoring Strategy (SWQMS), which describes a five-year basin rotation approach to monitoring for CWA purposes. Using this strategy, 1-2 basins (approximately 20% of the state) are monitored each year providing a comprehensive statewide data set for assessments every five years. These data are reviewed for the purposes of making 305(b) assessment and 303(d) listing decisions using IDEM's Consolidated Assessment and Listing Methodology (CALM).

Most of the data used in this report comes from IDEM's Watershed Monitoring Program, which employs a stratified random sampling design (probabilistic) to generate a representative sample

set for each basin. This approach allows IDEM to make assessments at two spatial scales. IDEM uses probabilistic results to make comprehensive use support assessments, which are statistically valid statements about the overall water quality within a given watershed. The same data used to make comprehensive statistical assessments for a given basin are also applied to the specific stream or stream reach from which they were collected in order to make stream-specific assessments. In addition to data from IDEM's Watershed Monitoring Program, results from other IDEM monitoring programs were used to make the water quality assessments included in this report. These programs include IDEM's Fixed Station Monitoring Program, the Source ID and Stressor ID Programs, the Fish Tissue Contaminant Program, and Special Studies Program. Results from IDEM's Lakes Monitoring Program, which operates under a contractual agreement with Indiana University, were also used.

A summary of IDEM's methods for determining support of beneficial uses is provided in the Assessment Methodology and Summary Data Section and IDEM's CALM is provided in its entirety in Appendix A of this report with Indiana's 303(d) List of Impaired Waters. Indiana's water quality standards (WQS) provide the basis for IDEM's CWA Section 305(b) water quality assessments (Appendix B), designating the beneficial uses that Indiana waters must support. Of the beneficial uses designated in the State's WQS, IDEM assesses aquatic life use support, recreational use support, and support of "fishable" uses. IDEM also assesses drinking water use support on surface waters that serve as a public water supply. Although there are additional uses designated in Indiana's WQS, IDEM limits its assessments to these four uses because the criteria in place to protect them are more stringent than those necessary to protect other uses. Thus, by protecting for these four uses, other uses such as agricultural and industrial uses are supported.

IDEM completed its first comprehensive aquatic life use support assessments for the entire state in 2002 and will report similar information for recreational uses in 2010. The 2002 IR was the state's first baseline report on water quality, which was revised in 2004 and 2006. The 2008 IR provides the most recent comprehensive report on Indiana water quality to date.

Results from IDEM's Comprehensive Use Support Assessments are provided in Appendix C of this report. Cumulative results for IDEM's stream-specific assessments are summarized in Table 1. Approximately 79 percent of the 17,535 stream miles assessed for aquatic life use were found to be fully supporting. Approximately 30 percent of the 12,073 stream miles assessed support full body contact recreational use. Almost all of Indiana's 59 miles of Lake Michigan shoreline outside the Indiana Harbor fully supports aquatic life use, while almost none of the shoreline waters support full body contact recreational use.

Causes of nonsupport (impairment) are reported for each waterbody type including rivers, lakes, Lake Michigan and its shoreline in Indiana and are discussed in more detail in separate sections of this report. Pathogens are the top cause of stream impairments, affecting over 8,000 miles of streams. Polychlorinated biphenyl (PCB) in fish tissue impacts over 3,000 miles while mercury impairments impact nearly 2,000 miles of streams. Over 2,000 stream miles also have biological communities with measurable adverse response to pollutants.

Table 1: Summary of Use Support - Assessed and Reported 1998 through 2007.

Designated Use	Support	Threatened[1]	Non Support	Assessed	Not Assessed
Rivers (miles)					
Aquatic Life Use	13,913	--	3,622	17,535	14,606
Fishable Uses	1,044	--	3,402	4,435	27,705
Drinking Water Supply[2]	--	--	1	1	101
Recreational Use (Human Health)	3,700	--	8,374	12,073	20,100
Great Lakes Shoreline (miles)					
Aquatic Life Use	59	--		59	--
Fishable Uses	--	--	59	59	--
Drinking Water Supply[2]	33	--		33	--
Recreational Use (Human Health)	--	--	59	59	--
Lake Michigan (acres)					
Fishable Uses	--	--	154,176	154,176	--
Lakes and Reservoirs (acres)					
Aquatic Life Use	3,690	--	6,625	10,315	21,826
Fishable Uses	7,820	--	63,663	71,483	5,084
Drinking Water Supply[2]	230	--	16,385	22,905	12,926
Recreational Use (Human Health)	21,922	--	983	22,905	104,662
Recreational Use (Aesthetics)	29,035	--	8,006	37,041	90,526

Source: IDEM's Assessment Database

[1]EPA recommends that states consider as threatened those waters that are currently attaining WQS, but are projected as the result of applying a valid statistical methodology to exceed WQS by the next listing cycle (every two years). IDEM recognizes the federal requirement to list waterbodies that meet U.S. EPA's definition of "threatened". However, IDEM has not determined the appropriate predictive models for the purposes of identifying future impairment. Based on this and the uncertainty associated with such models, IDEM does not assess waterbodies as "threatened" for the purposes of 303(d) listing. Waters for which there is reason to suspect a declining trend in water quality are so noted in IDEM's assessment process and in the agency's assessment database so that they may be prioritized for future monitoring when resources allow.

[2]While all waterbodies in Indiana are designated for aquatic life use, and recreational uses, not all are designated for drinking water use. There are a total of 29,541 lake acres and 132 stream miles (including 33 miles of shoreline) currently designated for drinking water in Indiana.

BACKGROUND

Introduction

Indiana is located on the eastern edge of the North American great interior plains. The North - South continental divide traverses through northern Indiana, draining watersheds into the Great Lakes basin and the Mississippi River and Ohio River systems. Surface water in the northern one-quarter of the state flows north into the Great Lakes and then through the St. Lawrence River to the Atlantic Ocean. The southern three-quarters of the state drains into the Ohio River or Illinois River and flows into the Mississippi River then south to the Gulf of Mexico. There are

35,673 miles of Indiana rivers, streams, ditches and drainage ways listed at the 1:100,000 scale in USEPA River Reach File 3 (RF3). State water types are described in Table 2. Metadata and definitions for this report are located in Appendix D.

Table 2: Atlas.

Description	Value	Units
Indiana population[1]	6,080,485	
Indiana surface area[2]	36,291	sq. mi.
Total miles of rivers and streams[3]	35,673	miles
Number of publicly-owned lakes/ reservoirs/ ponds[4]	575+	
Publicly-owned lakes/ reservoirs/ ponds[4]	106,205	acres
Great Lakes[4]	154,240	acres
Great Lakes shoreline[5]	59	miles
Fresh water wetlands[6]	813,000	acres

WATER POLLUTION CONTROL PROGRAM

Water quality standards have been adopted for the Great Lakes Basin watersheds and for the non-Great Lakes Basin watersheds. National Pollutant Discharge Elimination System (NPDES) permitting is the primary point source control process used in Indiana. Nonpoint source pollution is addressed primarily through nonregulatory watershed management planning and implementation projects.

Watershed Approach

Environmental problems often cut across political jurisdictions. Consequently, environmental mitigation and protection require a comprehensive and collaborative approach that works with a multitude of programs and agencies. The watershed approach provides a framework for coordinating between multiple programs and leveraging limited resources. This approach focuses on water quality in a geographic area delineated by a watershed. In order for all of the waters of the State of Indiana to support designated uses, IDEM uses an integrated approach that includes a common information base and agreement on roles, priorities, and responsibilities for managing watershed activities. IDEM's watershed approach includes:

- Ensuring that internal resources continue to be focused on addressing the most significant water quality issues facing Indiana by conducting a semi-annual review of OWQ activities and making any necessary adjustments;
- Improving internal coordination between OWQ's TMDL, water quality assessment and watershed planning and implementation programs to facilitate an integrated watershed management approach to restoring impaired waterways; and

- Improving coordination with local watershed groups, community groups, and other state and federal agencies to better leverage OWQ efforts in ways that will achieve greater improvements in water quality.

In 2007, IDEM OWQ has created the Watershed Initiative Task Force to verify whether resources are being allocated effectively to improve water quality in Indiana. The task force is comprised of members from all programs within the OWQ and is intended to improve the communication between programs and maximize resource effectiveness.

IDEM's water quality monitoring also employs a watershed approach. A statewide rotating basin approach to watershed monitoring was adopted in 1996. The rotating basin plan makes it possible to update water quality assessments on a five-year cycle for monitored watersheds throughout the state and ensures that the information available for planning and watershed management activities is no more than five years old. The water quality assessments included in this report are cumulative and include all waterbodies that have been assessed to date in all basins of the state. Figure 1 shows the monitoring locations for all of IDEM's sampling programs and illustrates the sampling density achieved through IDEM's water quality monitoring strategy over the past five years (2003-2007).

Figure 1: Monitoring Location Density

Water Quality Standards (WQS) Program

Indiana's WQS underwent significant revision in 1990. At that time, numerical criteria for all pollutants for which USEPA had developed either human health or aquatic life ambient water quality criteria were added to the standards. Procedures for developing additional criteria were also included in these rules. Additionally, all waters were designated for full body (primary) contact recreational use, and the bacteriological indicator organism was changed from fecal coliform to *E. coli* to conform to USEPA's guidance on bacteriological indicators. All waters in Indiana, with the exception of the 29 waterbodies designated in Indiana's WQS as limited use

waters[1] and the 11 waterbodies designated as exceptional use waters[2] were designated for warm water aquatic life use, full body contact recreational use, public water supply (where there are drinking water intakes from surface waters), industrial uses, and agricultural uses. Certain waters, where natural temperature conditions will support cold water fisheries, were so designated. For those waters where multiple uses exist, the criteria that support the most stringent uses must be met.

In 1993, the rules and regulations that guide the implementation of Indiana's WQS through Indiana's NPDES permits were extensively revised. Although this revision resulted in significant changes to these rules, only minor changes were made to Indiana's WQS. With the issuance of the final Great Lakes Water Quality Guidance in 1995, Indiana began the process of revising the WQS and implement regulations for those waters in Indiana's Great Lakes system. This rulemaking, for the most part, had no immediate effect on Indiana's waters located outside the Great Lakes system. These revisions incorporated the various criteria and procedures (or equivalent ones) identified in the guidance into Indiana's WQS. As a part of this rulemaking, Indiana also developed procedures to implement the antidegradation policy for all substances discharged to waters in the Great Lakes system. These revisions were adopted by the Indiana Water Pollution Control Board (WPCB) effective in February 1997 and submitted to USEPA for approval. In August of 2000, USEPA formally approved these revisions with the exceptions of the sections on reasonable potential for whole effluent toxicity and variances. For these parts of the rule, USEPA promulgated the federal guidance language for Indiana.

The WPCB adopted additional changes to Indiana's WQS in 2004. The revised standards:

- changed the way metals criteria are expressed in waters outside the Great Lakes system from "total" or "acid soluble" to dissolved metals;
- changed the way cyanide is expressed from "total" cyanide to "free" cyanide in these same waters;
- changed the point of application of the dissolved solids criterion from "all waters" to the "point of water intake" for drinking or industrial water supplies in waters outside the Great Lakes system;
- changed the sulfate criterion from 250 mg/L to 1000 mg/L, which would apply outside a mixing zone;
- added provisions to allow site-specific modifications to aquatic life criteria using the "recalculation procedure" and the "water effects ratio" without having to go through a rulemaking (these procedures were incorporated into the standards) and listed several water reaches where site-specific criteria had been developed;
- made changes to the list of bio-concentrating chemicals of concern (BCCs) in waters outside the Great Lakes system so as to be consistent with the list applicable to the Great Lakes system;

[1]The 29 streams or stream reaches designated for limited use in 327 IAC 2-1-11(a) were placed in this category after use attainability analyses confirmed the inability of these streams to fully support aquatic life use due to natural low flow conditions throughout much of the year. Thus, all waters in the state are currently designated for uses consistent with the requirements of the Clean Water Act or USEPA's implementing regulations and have criteria appropriate to determine support of these uses.

[2]Exceptional use waters are identified in 327 IAC 2-1-11(b)

- made changes in definitions and narrative criteria in order to achieve more consistency between waters within and outside the Great Lakes system;
- made a number of other minor technical and grammatical changes.

These changes to the WQS were approved by USEPA in 2005 with two exceptions. USEPA is still evaluating the proposed change in the sulfate criterion and has disapproved one site-specific criterion that was proposed. With regard to the sulfate criterion, the USEPA took no action on the revised sulfate criterion submitted for approval. USEPA determined that Indiana's revised sulfate criterion is not protective of aquatic life in waters with an ambient hardness value of less than 109 mg/l, based on toxicity studies carried out by the Illinois Natural History Survey. Therefore, USEPA is requiring IDEM to revise and readopt a sulfate criterion that is protective of aquatic life in waters with an ambient hardness value of less than 109 mg/l. The revised criterion is based on hardness and chloride concentrations and is scheduled for final adoption by the WPCB in March 2008.

Indiana is currently in the process of reviewing and revising the WQS applicable to all waters of the state with regard to the development of antidegradation implementation procedures. In the future, IDEM will be considering modifications to the state's bacteriological criteria.

Other portions of the current standards are under consideration for possible updates. IDEM believes that the criteria and methodology to calculate aquatic life criteria utilized in the Great Lakes system represent the most current scientific thinking on how to incorporate existing toxicity data into aquatic life criteria. Therefore, these aquatic life criteria and the methodology for calculating criteria should replace those currently used for waters outside of the Great Lakes system. Likewise, USEPA's 2000 guidance on deriving human health-based criteria should be utilized in updating current criteria and methodology for calculating these criteria in all waters of the state.

IDEM has collected considerable data on the macroinvertebrate and fish communities for many Indiana waters. Although Indiana is not at the stage in the evaluation of these data to propose numerical bio-criteria, narrative bio-criteria language that would allow the state to better utilize the available data to assess the biological integrity of aquatic communities may be proposed in the future.

Indiana is currently working with USEPA Region 5, other Region 5 states and the United States Geological Survey (USGS) to develop nutrient criteria for different water body types throughout the region. Indiana has submitted a Nutrient Criteria Development Plan and schedule for the development of nutrient criteria to the USEPA and provides updates to the plan on an annual basis. IDEM has worked with the USGS to collect information pertinent to the development of nutrient criteria in all of our major water basins over the past five years, and USGS is currently in the process of analyzing these data. IDEM's plan currently calls for the development of nutrient criteria by the end of 2009 and for the state to put these criteria into state WQS in the following triennial review period. USEPA guidance appears to give states additional flexibility in the development of nutrient criteria, especially if the state and USEPA have agreed on a plan to accomplish this goal. Indiana is actively participating in this effort, and IDEM's plan has been approved by USEPA.

Ground water quality standards became effective in March 2002. Public water supply definitions have been formalized to be consistent with federal Safe Drinking Water Act (SDWA) definitions. IDEM has established minimum requirements for content of Consumer Confidence Reports which public water suppliers deliver to their customers annually.

Point Source Program

Point source pollution in Indiana is controlled primarily through permits issued by IDEM for discharges to surface water under the NPDES program. All facilities which discharge to waters of the State must apply for and receive a NPDES permit. Unpermitted dischargers and permittees out of compliance with their permit conditions are referred to IDEM's Office of Enforcement for corrective actions, which can include fines.

Limitations are established in each NPDES permit in order to meet both the technology-based and water quality-based requirements of the federal CWA and Indiana's state laws, which are intended to protect all designated and existing uses of the water body. In addition to issuing NPDES permits, the program includes these other activities: wastewater treatment plant inspections, operator assistance and training, compliance data review and tracking, and enforcement.

Over the past two years, the NPDES permitting program systematically identified major issues that have complicated final determinations for many NPDES permits. Based on this information, IDEM has developed a number of internal policies, procedures, and guidance documents to enhance the program's ability to issue and reissue NPDES permits. IDEM's NPDES program is pursuing additional changes within the regulatory framework to complement these efforts.

In 2003, IDEM identified and prioritized administratively extended NPDES permits and created a plan to address these permits. First, IDEM created a list of permits to issue over the next year. Second, IDEM identified its current resources and estimated additional resource needs. Third, staff worked to identify next steps for each permit, developed timeframes for each step in the process, and created schedules for issuing these permits. Over the last two years, OWQ committed to reissue 26 priority permits and exceeded that goal by reissuing 33 permits. The backlog of minor NPDES permits has also been significantly reduced.

In order to reduce untreated discharges to Indiana's surface waters, IDEM's NPDES program also issues industrial wastewater pretreatment permits to industries that discharge to municipal wastewater treatment plants and industries that were delegated to operate their own pretreatment programs, and for urban wet weather discharges. NPDES staff oversees and audits municipal pretreatment programs in 45 municipalities with industrial dischargers. In addition, storm water runoff associated with land disturbing activities of one acre or more and runoff associated with industrial activities are now regulated by permits. IDEM is now implementing its EPA approved workplan for review and approval of Long Term Control Plans (LTCPs) and has approved 49 LTCPs to date, 2 of which are in federal consent decrees.

Discharges of toxic pollutants is controlled through permit limits for specific chemicals and by whole effluent toxicity limits. Compliance is provided for by IDEM's Permit Compliance Branch and by providing facility operation technical support for wasteload allocation modeling and monitoring. These program areas work closely with the NPDES permitting program to

ensure that permit limits are adequate for protection of designated uses and dischargers remain in compliance with these limits.

Permits for dischargers within the Lake Michigan and Lake Erie basins are written to incorporate Indiana's updated water quality standards. This change was implemented as a result of the federal Great Lakes Initiative (GLI).

IDEM inspectors conduct unannounced onsite wastewater treatment plant inspections throughout the state. In addition, IDEM is increasing its focus on laboratory proficiency and proper certification of wastewater treatment plant operators. Inspectors review operation and maintenance of wastewater treatment plants permitted under the NPDES program and provide referrals for operator assistance and training. Inspectors can also initiate violation letters prior to legal action as needed, and directly refer permittees to IDEM's Office of Enforcement for corrective action.

IDEM's NPDES permits are the cornerstone of the point source control program. IDEM actively works to stay in contact with permittees through the inspection program and the permit renewal process. The programmatic efforts described in this section and the various permits issued through IDEM's NPDES program are intended to reduce untreated discharges to Indiana surface waters and to ensure that treated discharges do not cause or contribute to impairment of Indiana's surface water resources.

Nonpoint Source Control Program

Nonpoint source (NPS) pollution in Indiana is addressed in many ways by a number of agencies and organizations in the state. IDEM's efforts to reduce nonpoint source pollution to Indiana waters are led by the Nonpoint Source/Total Maximum Daily Load (NPS/TMDL) Program. These two programs previously operated as separate sections within IDEM but were merged into one section in 2005 to better coordinate efforts at controlling nps pollution. In partnership with other agencies, the NPS/TMDL Section leads efforts to restore waters of the state that do not meet WQS and are on Indiana's 303(d) List of Impaired Waters. IDEM also employs five Watershed Specialists (WSS) who assist the NPS/TMDL Section in promoting the watershed approach by working with local watershed groups.

IDEM's Nonpoint Source Program

The NPS Program administers the CWA Section 319 and 205(j) grant programs, which together provide a significant portion of funding available to address nonpoint source issues in Indiana. The NPS program currently manages more than 75 grant projects that are working towards reducing NPS pollution. In addition to numerous watershed projects, the NPS program also provides funding for the Indiana Clean Lakes Program, which addresses nps pollution issues in lakes and reservoirs throughout the state.

The NPS program conducts training and provides technical assistance on watershed management planning and implementation and has produced valuable resources for watershed planning, such as the Indiana Watershed Planning Guide and the Indiana Water Quality Atlas (IWQA).

In August 2003, the NPS program revised the Indiana Watershed Planning Guide with input from watershed coordinators throughout the state. This document is available online at:

http://www.in.gov/idem/programs/water/wsp/index.html

and provides guidance for local watershed groups to develop watershed plans that meet USEPA Section 319 nine required elements. The NPS/TMDL Section encourages local agencies and groups to use the guide to develop a watershed management plan for their watersheds through a stakeholder driven process.

The IWQA is an internet mapping and analysis tool developed for watershed coordinators and other interested parties to provide water quality data over a framework of geographic datasets for evaluation and communication of watershed data and issues. The IWQA can be used by watershed groups in their watershed planning and implementation activities and is available online at:

http://iwqa.idem.in.gov/

Updates to the IWQA are conducted annually. Currently, the IWQA is undergoing an upgrade that includes additional mapping and analysis tools such as the Watershed Delineator and the L-THIA Model developed by Purdue University and more high-resolution datasets for running the delineator and model. These upgrades and testing of the site are expected to continue through March of 2009.

Many of the projects funded with NPS program grants include the collection of water quality data for watershed planning and other purposes. Under grant agreements, projects funded by IDEM routinely submit these data to the NPS program. The NPS program has initiated a project to upgrade IDEM's Assessment Information Management System (AIMS) database in order to improve the NPS program's ability to manage these data and make them more readily available for review and potential use in other agency programs. In addition to data collected by NPS projects, the AIMS database project will provide for the storage and facilitate the review of third party datasets submitted to IDEM for potential use in making the 305(b) assessments reported in the state's IR.

In addition to providing tools to assist watershed management efforts, the NPS program has adopted a targeted approach to improving water quality in the state by focusing IDEM's Section 319 funds on impaired waters. IDEM has identified funding priorities for Section 319 grants for the last several funding cycles. For federal fiscal years 2006, 2007 and 2008, the program focused on:

- Watershed management planning and implementation in areas with approved TMDLs;
- Watershed management planning and implementation in areas with waterbodies on the 2006 Section 303(d) list; and
- Implementation of watershed management plans that meet the IDEM checklist that includes the EPA required nine elements

A Geographic Information System (GIS) map was created to identify areas that have been involved in the planning and implementation of watershed management plans and the

relationships with the TMDL development activities. The map shows the areas of Indiana where there are watersheds with nps impaired waterbodies as listed in the 2006 303(d) List of Impaired Waters. This map facilitates the use of the targeted approach to watershed management providing for coordination of TMDL, planning, and implementation efforts in areas of the state most in need of restoration. Targeting areas for watershed planning to coincide with TMDL development or where TMDLs have already been developed helps expedite the planning process and provides groups with information in the TMDL regarding watershed nps problems, sources and needed load reductions.

IDEM's Total Maximum Daily Load Program

IDEM's TMDL program focuses almost exclusively on nonpoint source related impairments and has developed 559 TMDLs to date. There are another 548 TMDLs either in progress or planned for 2008. Indiana's early TMDLs were developed primarily through the use of third party contractors. IDEM's TMDL program now develops most of its TMDLs in-house. In addition to being more cost-effective, agency development of TMDLs provides the opportunity for more effective coordination with IDEM's NPS program and other relevant water quality programs. In addition to developing TMDLs focused on *E. coli* impairments, IDEM staff are now developing TMDLs for other nps-related issues such as impaired biotic communities and nutrient impairments.

IDEM's TMDL program has been awarded considerable funding from USEPA through contractor support grants to develop additional TMDLs. In addition, IDEM's TMDL program has collaborated with both Illinois and Michigan on TMDL development for interstate waters and leads the nation in the development of TMDLs for impairments in waters that cross state lines.

IDEM's TMDL Program works closely with the NPS program and IDEM's WSS to develop TMDL reports that can be effectively used by local watershed groups and stakeholders to facilitate the restoration of impaired waters. The TMDL program also coordinates with local governmental agencies and stakeholders within the TMDL area. This coordination provides numerous opportunities for local participation in the TMDL process, which leads to positive changes in the watershed. Since 2004, the coordinated efforts of the NPS/TMDL Section and IDEM's WSS have resulted in the formation of ten new watershed groups and new grant -funded projects for planning and restoration activities in impaired watersheds.

IDEM's Watershed Specialists

IDEM's five WSS provide an important link between watershed groups and other interested stakeholders and OWQ programs. In 2007, the WSS assisted more than 80 watershed groups on many levels including: meeting facilitation, reviewing draft and final watershed management plans, reviewing grant proposals, providing water quality data and watershed maps, connecting them with other local organizations and agencies to complement planning efforts, and assisting watershed coordinators with the overall watershed planning and implementation processes. The WSS also work with the TMDL program by attending TMDL public meetings to provide information on watershed planning and building local partnerships to address water quality. The WSS have assisted with the formation of more than ten local watershed groups in areas with

completed TMDLs. These groups are currently developing and implementing watershed management plans to restore those impaired waters.

Coordination with Other Agencies

IDEM has working relationships with other state and federal agencies interested in improving water quality in Indiana. In addition, results of projects completed by local and regional government, university and nonprofit organizations are integrated into reporting processes whenever possible.

IDEM's efforts to address nps pollution rely heavily on the efforts of federal, state, and local partners. With the extent and variety of nps issues across Indiana, the need for cooperation across political boundaries is essential. Many local, regional, state, and federal agencies play an essential part in addressing nonpoint source pollution, especially at the watershed level. They provide information about local concerns and infrastructure and build support for the pollution control practices that are necessary to reduce and prevent nps pollution. By establishing coordination frameworks to share information and resources among agencies at different levels of government, IDEM can more effectively focus its water quality protection efforts.

Much of this coordination occurs on an ad hoc basis. However, IDEM works closely with the Natural Resources Conservation Service (NRCS), the Indiana Department of Agriculture (ISDA), the Indiana Department of Natural Resources (IDNR), and the Indiana Association of Soil and Water Conservation Districts (IASWCD). A workgroup comprised of key staff from these organizations meets on a bi-monthly basis to exchange information and work toward better coordination of programs and resources on their mutual goals to reduce nps pollution. IDEM has broadened discussions to include emerging issues on urban stormwater and wetland regulation. In addition to participating in this workgroup, IDEM also works with the IDNR Coastal Zone Program to address nps issues in the Lake Michigan watershed.

IDEM's WSS act as liaisons between federal, state and local programs and officials to ensure all interested parties are aware of pertinent watershed management activities and to promote coordination and integration of those activities with other local planning efforts. In addition to working with individual watershed groups, the WSS work with the Indiana Conservation Partnership which includes representatives from NRCS, ISDA, IDNR, IASWCD, and the Purdue University Extension Service.

IDEM staff in the Water Quality Certification program work cooperatively with several U.S. Army Corps of Engineers (ACOE) districts, IDNR, the U.S. Fish and Wildlife Service (USFWS) and other agencies to issue permits that are protective of water quality, regulating activities in wetlands and other waters pursuant to CWA Section 401.

Coordination with Indiana Department of Natural Resources

From 1999-2002, IDEM and IDNR worked cooperatively to develop and implement the Hoosier Riverwatch Program, a statewide volunteer stream water quality monitoring program. The goal of this program was to educate citizen volunteers in water quality monitoring methods and to electronically store their results to make them available to other interested parties such as watershed groups, schools and to IDEM technical staff for potential use in various OWQ programs. IDNR, Division of Fish and Wildlife staff have taken the lead in developing the program, which has trained more than 7,000 volunteer stream monitors to date. Since 2001, volunteers have registered results for nearly 1,000 sites into the Hoosier Riverwatch database. The Hoosier Riverwatch database is web-based and interactive, allowing volunteers to enter their own data and view other volunteers' data. In 2007, the program completed a three-year regional research project in cooperation with cooperative extension programs in Iowa, Ohio, Michigan, Wisconsin, and Minnesota to test the accuracy of bacteriological monitoring methods used by volunteers and the usability of their results. More details on this project can be found at:

http://www.usawaterquality.org/volunteer/EColi/

The IDNR Division of Reclamation Abandoned Mine Lands (AML) Program has worked very closely with NPS/TMDL staff on the development of a TMDL in a watershed with abandoned mines. The AML program shared water quality data, information on costs and techniques of reclamation projects, and educated NPS/TMDL staff about areas impacted by acid mine drainage by touring reclamation projects at different points in the reclamation process.

Coordination with the Indiana Association of Soil and Water Conservation Districts

The mission of the IASWCD is to represent county soil and water conservation districts (SWCD) as one voice and to assist the leadership of local soil and water conservation districts through coordination and education for the wise use and management of our natural resources.

One of the many ways the IASWCD promotes the wise use of Indiana's natural resources is by providing information and outreach in support of statewide efforts to develop and enhance Indiana's watershed program and help address NPS pollution. Section 319(h) funds are used to staff a Watershed Information Specialist (WIS) position at the IASWCD. This position serves as a liaison with IDEM OWQ staff to help promote watershed management efforts throughout the state.

- The WIS serves as a key contact for SWCDs via the IASWCD Weekly Update, developed under this contract to regularly communicate issues, events, and resources in watershed management statewide.
- Met regularly with IDEM WSS and Watershed Planning Branch Chief for communication and planning purposes. This included initiating, coordinating, and facilitating a reoccurring Watershed "Team" Meeting, inviting members of NPS/TMDL and Wetlands/Rules Sections to participate, as well as representatives from NRCS, ISDA, IDNR, and the IASWCD. These meetings served as an opportunity to update, network, and discuss current work in watershed management and water quality.
- Participated in the strategic planning process for the WSS, facilitating document development.

- Assisted in the development of watershed-based information lists. The first is a list of local contacts, including SWCD supervisors, staff, and technical partners, watershed coordinators, and agency staff, which was created and has been maintained throughout the contract term. The second list has been referred to as an 'inventory'. Identifying past and current efforts in watershed management is a comprehensive and necessary element for increasing program delivery efficiency and maximizing partner/public dollars. Discussions were initiated with Purdue University, CTIC (Conservation Technology Information Center), IDNR, NRCS, and IDEM to determine existing inventories of activities across the state. Coinciding with this activity, the WSS staff identified the need for an internal database designed to track watershed groups and group process. Working with IDEM staff, this position participated in meetings and worked with NPS/TMDL staff members to develop a database framework that can be spatially referenced in ArcGIS.

Coordination with the United States Geological Survey

The USGS has worked with NPS/TMDL staff to provide information, data, and sampling assistance for the development of TMDLs. USGS prepared a presentation and brought in specialists to discuss data collected in a watershed with a TMDL under development to assist in determining biological impacts. USGS has also provided training to NPS/TMDL staff on the new INStreamStats Model. Staff can now assist watershed groups in the use of this valuable new tool.

USGS has also been monitoring cooperatively with IDEM at randomly selected sites in each of the five major river basins that are sampled on an annual rotating basis to collect phytoplankton and algal biomass chlorophyll *a* samples as well as physical and chemical data. This information is being used in conjunction with biological (macro-invertebrate and fish community), chemical, and physical data collected by IDEM to try to determine potential cause and effect relationships between nutrient concentrations, algal responses and biological condition. These studies form one of the basic components of Indiana's nutrient criteria development plan.

The USGS National Water Quality Assessment (NAWQA) study sites in Indiana also contribute to Indiana's work in developing nutrient criteria for the state. Data gathered at these sites are providing Indiana with useful information regarding seasonal and annual trends of nutrient and algal concentrations and their potential effects on the biotic community. The USGS is also conducting fate and transport studies in the White River, West Fork and Sugar Creek watersheds, which will provide information about the fate and transport of nutrients in these waters. Results from these studies have also been incorporated into IDEM's nutrient criteria development plan.

Coordination with Indiana's State Revolving Fund Loan Program

The State Revolving Fund (SRF) Loan Programs provide low-interest loans to Indiana communities for projects to improve drinking water and wastewater infrastructure.

The SRF Loan Programs coordinate with state and federal programs, including IDEM OWQ, to identify ways the SRF Loan Programs might provide assistance to Indiana communities that will ultimately help to achieve common goals. For example, the Clean Water SRF ranking and scoring gives additional points for projects that remove a pollutant source from an impaired stream. This increases the likelihood of projects with a water quality benefit being high on the SRF project priority list. The SRF Loan Programs also serve on the Rural Wastewater Task

Force and the Environmental Infrastructure Work Group where they have the opportunity to provide input and offer financing options to communities. The SRF Loan Programs work with communities addressing combined sewer overflows, enforcement issues, or those with or nearing a sewer ban.

COST/BENEFIT ASSESSMENT

Cost Information

The State Revolving Fund (SRF) Loan Programs provide low-interest loans to Indiana communities for projects that improve drinking water and wastewater infrastructure. The Indiana Finance Authority administers these programs to protect public health and the environment.

Cities, towns, counties, regional sewer/water districts, conservancy districts, and water authorities are eligible for both programs. Private and not-for-profit public water systems are eligible for drinking water SRF loans. Eligible projects include those that abate water pollution problems, provide greater protection to public health or ensure compliance with either the CWA or the SDWA. Wastewater projects may include wastewater treatment plant construction or improvements, sewer line extensions to existing unsewered properties, decentralized systems, combined sewer overflow corrections and infiltration/inflow corrections. Drinking water projects may include treatment plant construction and improvements, water storage facilities, water distribution systems and water supply. There is an additional financial incentive to include green technology, a Brownfields Program project, or a sustainable infrastructure component to a project.

The SRF loan is a 20-year, fixed rate loan. To ensure a subsidized rate at the time of closing, interest rates may reset quarterly and are at or below 90% of the average 20-year AAA-rated, general obligation bond Municipal Market Data. Rates are further discounted based on the community's median household income (derived from current census data) and local user rates.

As an incentive to communities to address nonpoint source water pollution, the interest rate on their loan, for projects with a nps component, may be reduced by up to 0.5%. This results in a subsidy equal to as much as one-half the total cost of the nonpoint source project. This subsidy is realized in the form of savings through reduced loan payments over the twenty-year term of the loan. In State Fiscal year (SFY) 2006 and SFY 2007, eight projects had a NPS component and saved an additional $7,163,553.00 over the 20-year term of their loans. While these savings are realized over the longer term, these projects are typically completed within 2 years and the water quality benefits are achieved much sooner.

In state fiscal years 2006 and 2007, the Wastewater SRF Program closed 45 loans totaling approximately $383,715,000.00 and provided an estimated savings (compared to open market interest rates) of $70,742,630.00. The Drinking Water SRF Program closed on 21 loans for approximately $92,435,000.00 with an estimated savings to communities of $18,199,475.00.

Table 3: Investments in SFY 2006 and 2007

SRF Program	Number of Projects	Loan Amount	Savings Realized
Clean Water	45	$383,715,000	$70,742,630
Drinking Water	21	$92,435,000	$18,199,475

Since 1999, the SRF Programs have provided more than $1.9 billion dollars for over 375 wastewater and drinking water infrastructure improvement projects. Water quality benefits to many Indiana rivers and streams are expected as a result of the assistance to communities from the SRF Programs. Figures 2 and 3 show locations of loans closed throughout Indiana.

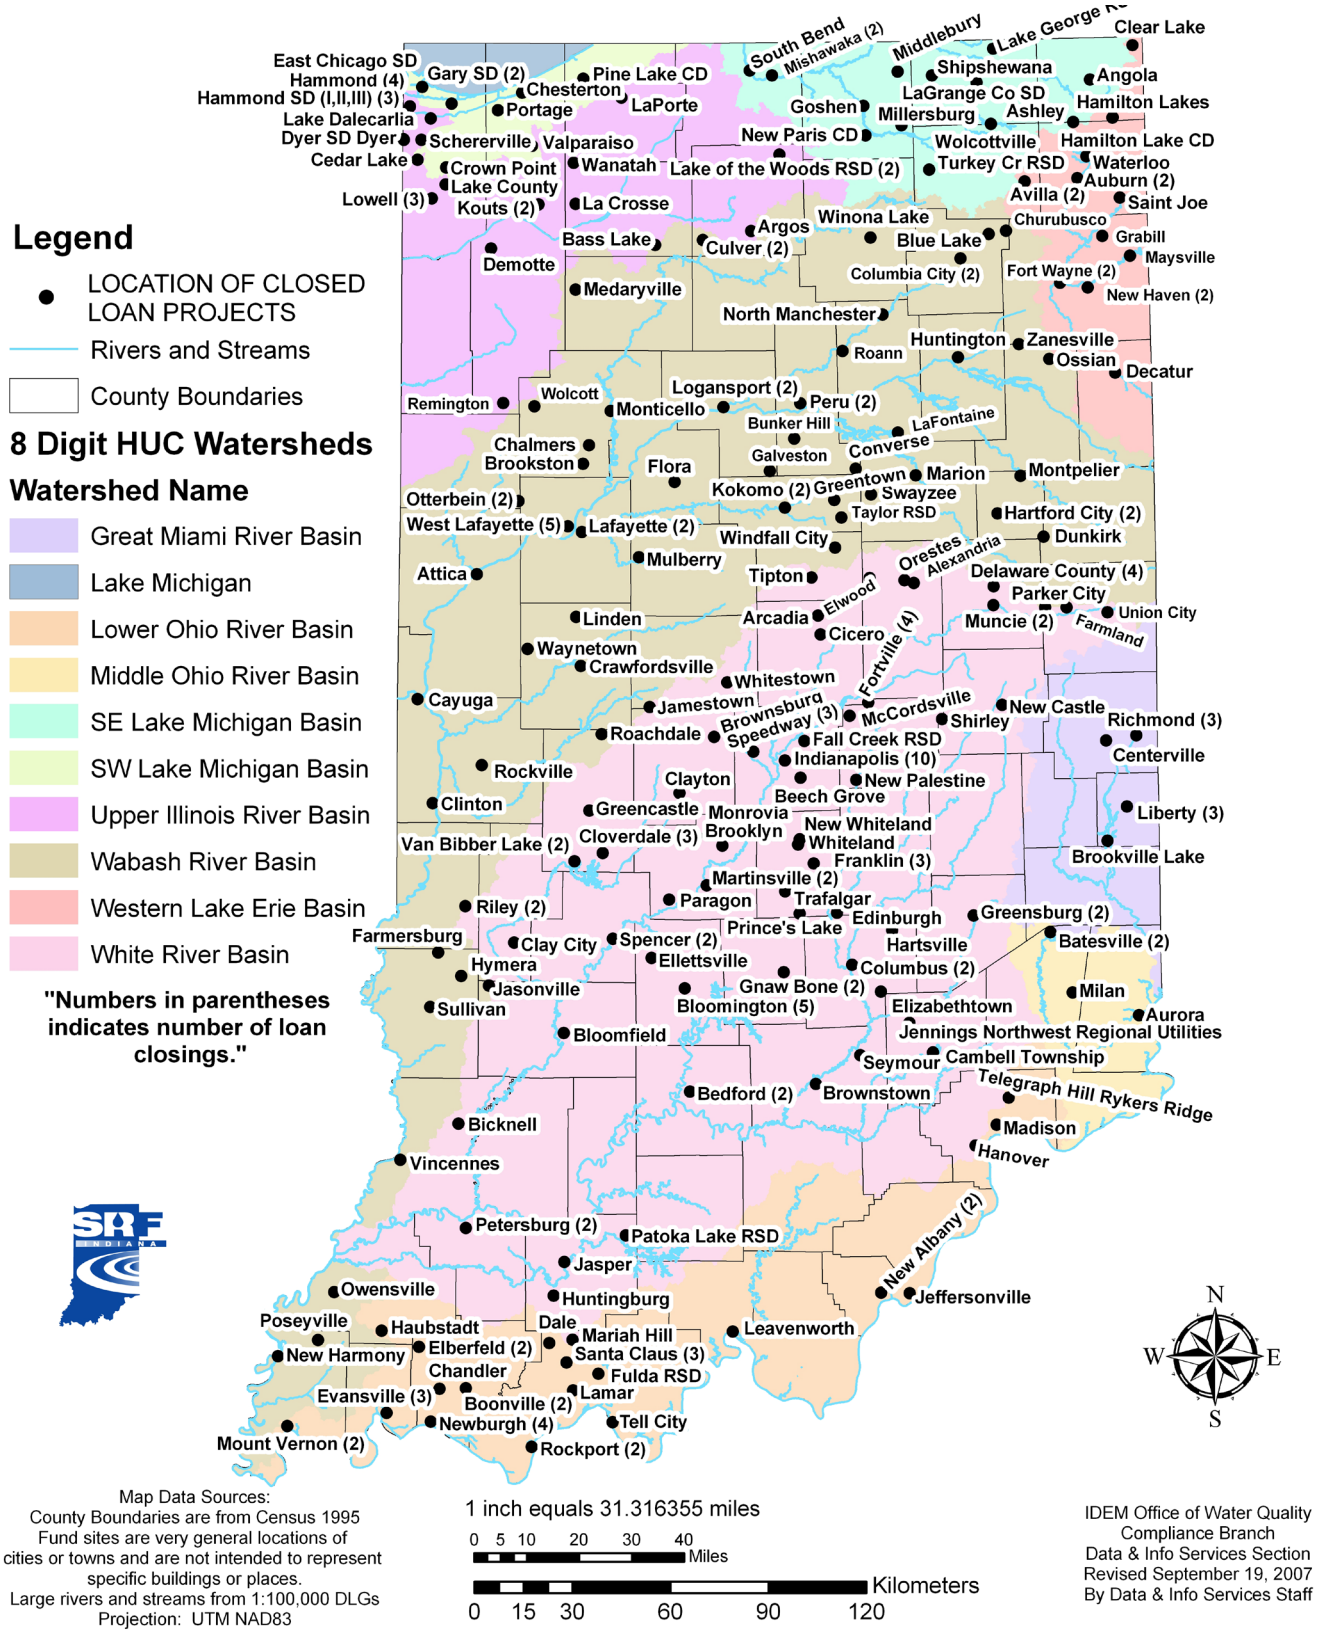

Figure 2: State Revolving Fund Clean Water Projects as of June 2007

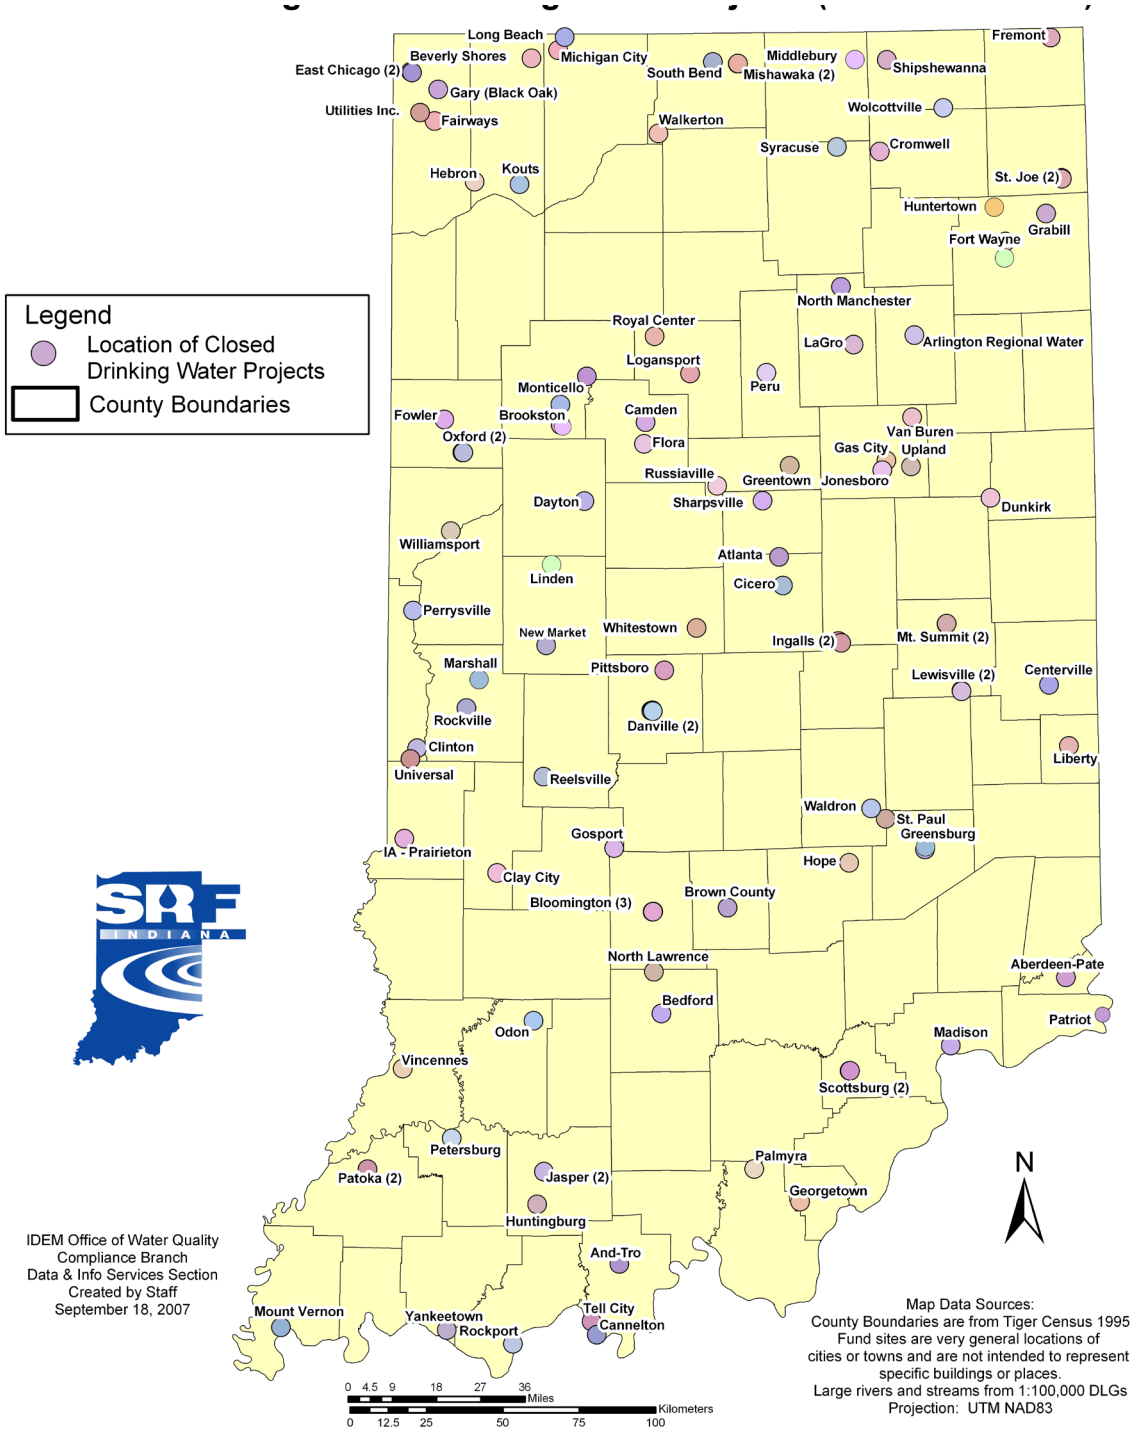

Figure 3: State Revolving Fund Drinking Water Projects as of June 2007

In addition to the SRF Program, IDEM's NPS Program awarded 205(j) grants totaling more than $1.9 million to 24 projects and awarded more than $17.6 million in Section 319 grants to 112 projects from 2003-2007. These federally funded grant projects include watershed management planning, water quality management, and nonpoint source pollution assessment, prevention, education, and restoration.

Benefit Information

According to the 2007 NPS Annual Report, the number of active watershed groups in Indiana has increased from 66 in 2005 to 82 in 2007. With the help of NPS implementation materials, the number of watershed groups that meet the USEPA nine required elements almost doubled from 25 groups in 2005 to 49 in 2007. The water quality benefits resulting from the funds that the NPS program administers include significant reductions in the amount of sediment, phosphorus, and nitrogen reaching Indiana waterways in the form of nps polluted runoff (Table 4).

Table 4: Reduction of Sediment, Phosphorus, and Nitrogen reaching Indiana Waters

Dates	Sediment Reduction (ton/year)	Phosphorus Reduction (lbs/year)	Nitrogen Reduction (lbs/year)
2000-2003	36,081	42,965	86,281
2004	18,612	22,056	44,651
2005	33,415	39,347	79,346
2006	24,765	39,445	97,187
2007	22,876	122,040	111,428
2008	4,429	8,345	22,134

On-the-ground Improvements to Water Quality – the Pigeon Creek Story

Pigeon Creek watershed is located within Posey, Warrick, Gibson, and Vanderburgh counties in southwestern Indiana. Pigeon Creek flows south where it meets the Ohio River upstream of the drinking water intake in Evansville, Indiana. IDEM placed thirty-two miles of the mainstem of Pigeon Creek on its 1996 303(d) List of Impaired Waters for chlordane and other priority pollutants based on fish tissue data indicating concentrations of these contaminants high enough to warrant the issuance of a fish consumption advisory. These impairments persisted through the 1998 303(d) listing cycle.

These impairments resulted from the use of these chemicals on agricultural lands with poor stream buffers and high historic soil loss. The primary land use in this watershed is agriculture, and crops in this watershed were historically treated with chlordane to control insects. Even though use of chlordane was prohibited in the early 1980s, high levels of this chemical persisted in the sediments in Pigeon Creek and its tributaries. Because these chemicals bond tightly to soils, IDEM and local watershed groups identified erosion from agricultural lands as the primary source of these pollutants.

In 1997 the Citizens for the Improvement of Pigeon Creek cooperated with the NRCS and the Vanderburgh County SWCD to develop a watershed plan for the portion of Pigeon Creek in Vanderburgh County. The partners received CWA Section 319 funding to support projects on Pigeon Creek and its tributaries, including enhanced watershed planning, education, and installing best management practices (BMP) such as filter strips, grassed waterways, field buffers, and conservation tillage.

This project was supported by $171,990 from two CWA section 319 grants (awarded in 1997 and 1999). Landowners and partner agencies within the watershed contributed an additional $42,997 in matching funds, in-kind services, and materials. Partners for the CWA section 319 grants included the Vanderburgh, Warrick, Gibson, and Posey County SWCDs, as well as the Four Rivers Resource Conservation and Development office. These partners helped to select sites for BMP installation, conduct education and outreach activities, and offer technical support. Monitoring and assessment of water quality in 2002 was funded by $78,001 from a CWA section 205(j) grant to IDEM's Assessment Branch. The IDNR, through the Lake and River Enhancement program, funded planning and BMP installation projects amounting to $270,000 in state funds. The NRCS greatly assisted this project by allocating $135,000 each year for the years of 1997, 1998, and 1999 through the Environmental Quality Incentives Program.

From 1997 through 2001 the partners installed more than 50 BMPs designed to reduce soil erosion in the Pigeon Creek watershed. And, locally led efforts continue to address sediment loading to streams in the Pigeon Creek watershed.

In 2002 IDEM assessed water quality in Pigeon Creek to determine whether a TMDL was still needed to address the impairment for chlordane and other priority pollutants and collected additional samples in 2005.

The allowable threshold level of chlordane at the time that the original samples were collected was based on the U.S. Food and Drug Administration's (FDA's) action level for chlordane, which was >0.02 parts per million (ppm) as a total of all isomers. The FDA has since revised this value. The current FDA action level cited for chlordane in fish tissue in the FDA handbook entitled "*Action Levels for Poisonous or Deleterious Substances in Human Food and Animal Feed*," is 0.3 ppm.

IDEM compared the 1992 and 2005 data to the current FDA action level for chlordane (see Table 5). Using the current FDA action level for determining impairment, the results indicated that Pigeon Creek was no longer impaired for chlordane. Based on these results, all 32 miles of the mainstem of Pigeon Creek previously impaired were removed from the state's 303(d) List of Impaired Waters.

Table 5: Comparison of chlordance concentrations in fish tissue from samples collected in Pigeon Creek.

Comparison of fish tissue chlordane isomer levels taken from channel catfish sampled in Pigeon Creek at Kleymyer Park, Evansville, Indiana. The sample point was located near the lowest point of the Pigeon Creek watershed.			
Parameter	**September 1992 sample results (wet weight)**	**August 2005 sample results (wet weight)**	**Percent Reduction**
Chlordane, Alpha-	.082 ppm	.014 ppm	83%
Chlordane, Gamma-	.056 ppm	.004 ppm	93%
Nonachlor, cis-	.055 ppm	.009 ppm	84%
Nonachlor, trans-	.11 ppm	.032 ppm	71%
Oxychlordane	.012 ppm	.001 ppm	92%
Total chlordane residue	.315 ppm	.060 ppm	81%
FDA action level for chlordane*	.3 ppm		
*Maximum concentration of allowable levels of chlordane residue in edible portions of fish tissue.			

These land treatment measures significantly reduced the amount of chlordane and other organic pollutants reaching the stream, allowing the legacy sources to be covered by cleaner sediments from other points in the watershed, moved naturally, or degraded over time.

The Pigeon Creek Watershed Management Plan is now addressing other water quality impairments in addition to those associated with chlordane and priority organic pollutants. IDEM and the local watershed group plan to track the status of these other impairments to determine what further work is needed.

Special State Concerns and Recommendations

IDEM has special state concerns regarding two significant issues that affect IDEM's water quality programs and its ability to achieve specific CWA objectives.

Developing TMDLs for Waters Impaired for Mercury and/or PCBs in Fish Tissue

Mercury and polychlorinated biphenyls (PCB) in fish tissue are among the top four causes of impairment to Indiana's waters. To date, states have received little guidance from USEPA

regarding how to develop a TMDL to restore a waterbody with fish tissue impairments for mercury or PCBs. Given this, IDEM has placed all fish tissue impairments in a separate category of the consolidated and 303(d) lists (5B) because it does not believe that, at this point in time, a conventional TMDL is the appropriate approach for addressing these impairments. Until adequate guidance is available, IDEM considers it more prudent to focus its limited resources on developing TMDLs on impairments for which appropriate methods have been established. IDEM urges USEPA to continue working toward development of guidance on how to effectively address fish tissue impairments.

Conflicting Monitoring Needs

For 2002, USEPA called for full integration of CWA Section 305(b) reporting and Section 303(d) listing processes into one consolidated report. Indiana complied and submitted its first IR in 2002. Since that time, it has become evident that while integration of these two CWA objectives solves some problems, a critical issue remains in the fact that the types of water quality monitoring required to support these two programs are not compatible. Until this issue is addressed on the federal level, states will continue to struggle to meet conflicting monitoring needs.

USEPA emphasizes a probabilistic monitoring approach in order to help states meet the CWA section 305(b) goal of comprehensively monitoring all waters of the state. IDEM's probabilistic monitoring program provides IDEM with the ability to make statistical inferences regarding the extent to which waters of the state, as a whole, support or do not support designated uses based on data collected randomly throughout the state. However, these statistical results do not indicate where each specific impaired stream is located.

While the data collected through probabilistic monitoring can be used to make site-specific assessments, the randomness built into the probabilistic study design does not allow for continued monitoring of those streams where impairments have been identified. Follow-up monitoring is needed for these waters in order to determine the full extent of these impairments and the stressors and/or pollutants driving them. However, IDEM cannot direct a larger proportion of its monitoring funds to meet the targeted monitoring needs because the minimum number of samples required to maintain the statistical rigor required by IDEM's probabilistic sampling design consume most of OWQ's monitoring resources, leaving comparatively very little funding to direct toward targeted monitoring. As a result, IDEM OWQ programs struggle with conflicting monitoring needs. The resources available to conduct the targeted monitoring necessary to meet other CWA mandates and USEPA performance measures are not keeping pace.

For example, USEPA now requires states to meet performance measures aimed at quantifying improvements in water quality resulting from TMDL implementation and/or watershed planning and restoration activities funded through Section 319 grants and other OWQ programs such as SRF and 104(b)(3) projects. IDEM is most interested in providing tangible measures of success of its programs. While there is clearly an emphasis, as measured by federal resource allocations, on accountability on the federal level, there does not appear to be a corresponding emphasis on the targeted monitoring required to provide them.

Indiana's 303(d) list continues to grow as a function of probabilistic monitoring required to meet CWA 305(b) goals while the federal funding devoted to targeted monitoring needed to better characterize and address these impairments does not. IDEM continues to monitor probabilistically, which results in a large number of waters being sampled for the first time every season. As a result, IDEM continues to find previously unidentified impairments. USEPA's most recent guidance (USEPA, 2005) recommends that states develop expeditious schedules of 8 to 13 years from the date of the original listing. While IDEM continues to make great strides in TMDL development, without additional resources allocated to the types of monitoring necessary for this CWA mandate, it will become increasingly difficult for IDEM's TMDL Program to keep pace with the number of new impairments identified each year.

With this report, IDEM has completed a second full round of its five-year rotating basin monitoring providing USEPA with a comprehensive aquatic life use assessment for the entire state based on probabilistic monitoring results. IDEM agrees with the need for continued probabilistic monitoring in order to determine overall trends in water quality throughout the state and over time and to provide additional data with which to assess previously unassessed waters. However, additional resources are needed to complete the targeted monitoring necessary to meet other CWA goals and USEPA objectives.

SURFACE WATER MONITORING AND ASSESSMENT

IDEM's Surface Water Monitoring Strategy

The Assessment Branch (AB) in IDEM OWQ is responsible for monitoring the surface water quality all across Indiana pursuant to CWA Section 305(b) and pursuant to Section 303(d) helps identify those waters of the state that are impaired. To accomplish these CWA requirements, the AB developed the Indiana Water Quality Monitoring Strategy (SWQMS) in 1996. The monitoring strategy was revised most recently in 2005 and is designed to provide technical data and information in support of:

- The annual update and biennial IR;
- NPDES permitting program;
- The annual Fish Consumption Advisory (issued by the Indiana State Department of Health in cooperation with IDEM and the IDNR);
- Drinking water source assessment; and
- Identifying past and emergent water quality trends.

IDEM's monitoring strategy follows a rotating basin approach. Approximately one-fifth of the state (1-2 basins) is scheduled for monitoring each year for five years (Figure 4). Monitoring is conducted within a given basin(s) and the results are analyzed for quality assurance and quality control (QAQC) in year one. In year two, the QAQC'd data are used to make water quality assessments for the basin(s). These assessments and any waterbody impairments identified through these assessments are reported in the third year, either electronically or in a narrative report. CWA Section 305(b) requires states to submit a narrative report in even-numbered years and an electronic update in odd-numbered years. As a result, each narrative IR now contains the results for two years' worth of monitoring and assessments. A detailed schedule of IDEM's 305(b) assessment and reporting, and 303(d) listing activities is presented in Appendix E.

The principle goals of the Indiana SWQMS: 2006-2010 are to:

- Measure the physical, chemical, bacteriological, and biological quality of the aquatic environment in all river basins and identify factors responsible for impairment;
- Assess the impact of activities that occur in all river basins and the probable effects of these activities on the quality of the ecosystem and drinking water source protection;
- Identify trends through analysis of environmental data from a variety of sources and make recommendations for the protection of designated uses of the water resources of the state; and
- Provide environmental quality assessment reports to support the water quality management program in partnership with customers and stakeholders.

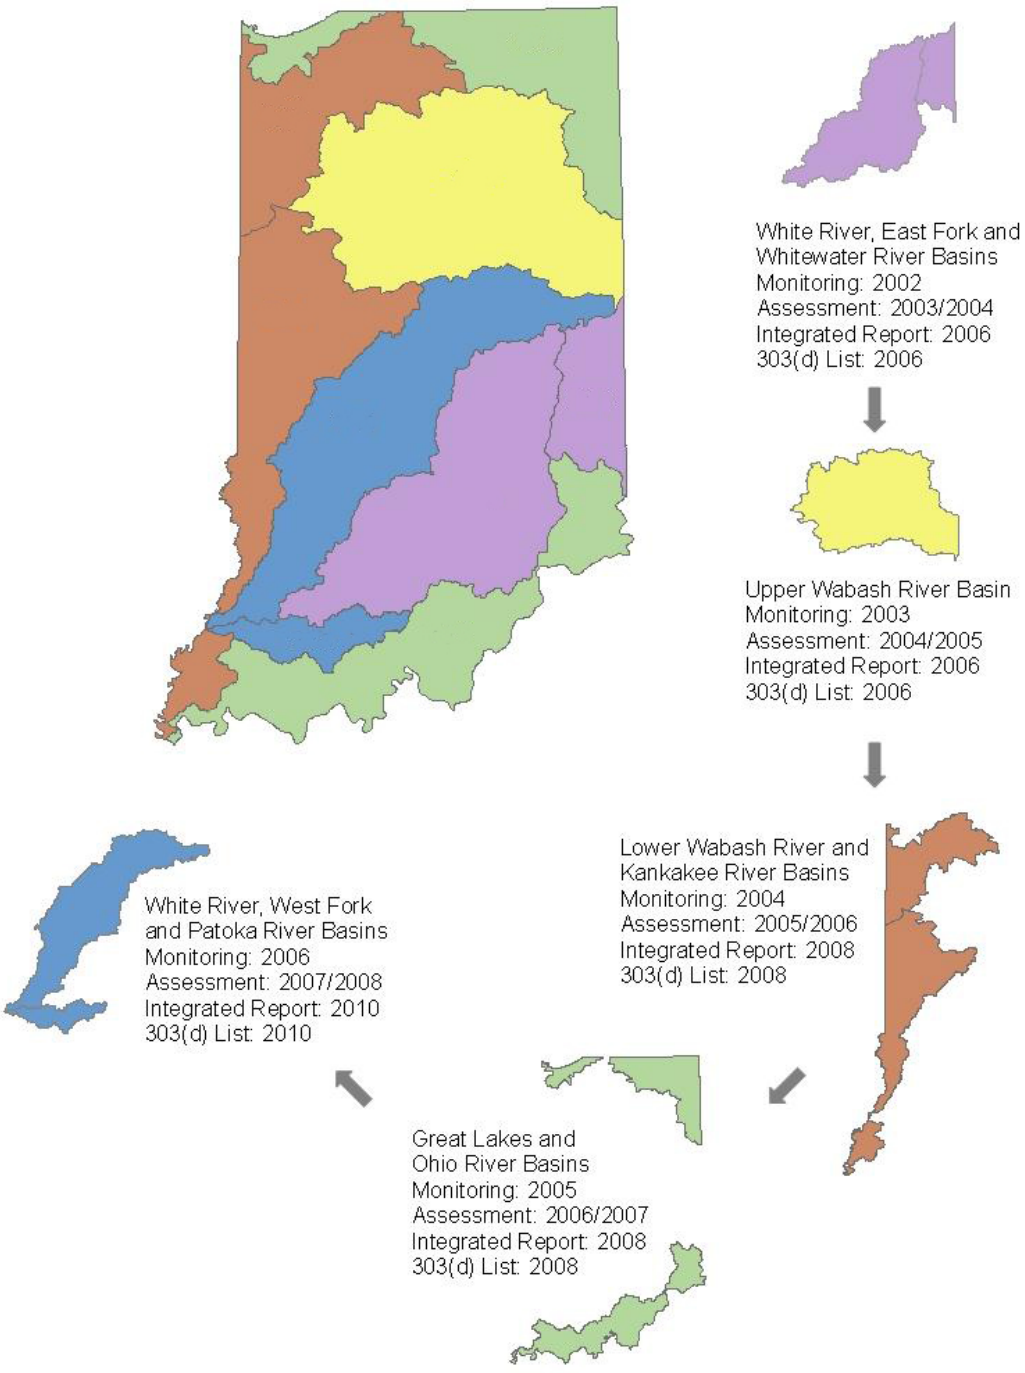

Figure 4: IDEM's Rotating Basin Monitoring, Assessment, Reporting and Listing Schedule.

The ideal monitoring program would be to sample everywhere all the time. However, such an approach would be cost-prohibitive and is unrealistic. An alternative is to sample a large number of randomly selected sites in a given watershed, which reduces bias. This is IDEM's approach. A chief component of the OWQ surface water quality monitoring strategy is the Watershed Monitoring Program, which is designed to characterize the overall environmental quality of each

major river basin and to identify those monitored waterbodies within each basin that are not fully supporting their beneficial designated uses. IDEM uses data from this program to make water quality assessments at two spatial scales:

- Comprehensive Use Support Assessments: These assessments are statistical in nature, based on the data collected by IDEM's Watershed Monitoring Program. This program employs a probability-based sampling design that allows IDEM to predict with reasonable certainty what percentage of Indiana's rivers and streams are impaired. However, it is important to note that while the data collected can be used to make statistically valid statements about the overall water quality within a watershed, these statements cannot be applied to specific stream reaches. IDEM's comprehensive aquatic life use support results are included in Appendix C of this report. IDEM began monitoring *E. coli* probabilistically in 2004, which will allow calculation and reporting of comprehensive recreational use support for all basins in Indiana by 2010 reporting cycle.
- Stream-Specific Use Support Assessments: The data used to make statistical comprehensive use support assessments are also applied to the specific stream or stream reach from which they were collected to assess its use support. Results from IDEM's stream-specific assessments are summarized in the Rivers and Streams Water Quality Assessment section of this report.

The principal advantage of the probabilistic monitoring approach is that it allows IDEM to meet the goal of providing a comprehensive statistical assessment of the overall water quality in each major basin while at the same time, providing a great deal of data that can be used to make stream-specific assessments (Figure 1). However, IDEM must continually balance the need for the probabilistic monitoring necessary to provide USEPA with comprehensive statistical assessments with the targeted monitoring necessary to achieve other CWA objectives. This is becoming increasing difficult as the number of CWA and other USEPA objectives requiring targeted monitoring increase.

This report provides comprehensive assessments for watersheds in all of Indiana's major basins in addition to summaries of results from IDEM stream-specific assessments. Watersheds that were previously reported, either in the form of an electronic update or narrative report, are included in this report.

On September 26, 2007, Indiana's draft 2008 303(d) List of Impaired Waters was published in the Indiana Register for the 90-day public comment period required by state law. In addition to the 90 days required, IDEM extended the public comment period to January 31, 2008 to provide interested stakeholders additional time to submit their comments on the draft list. To avoid adding impaired waterbodies to Indiana's 2006 303(d) List after it has been presented to the public for comment and to achieve consistency between the 305(b) report and the 303(d) list, Indiana does not include in this report the results of water quality assessments conducted after September 26, 2007. These assessments, which include the White River, West Fork and Patoka basins, will be included in the 2009 electronic update and incorporated into the narrative 2010 IR. Any streams that are assessed as impaired after September 26, 2007, will be addressed in the next draft of the 303(d) list to be included with the 2010 IR. This approach allows Indiana to meet USEPA's reporting deadlines and minimizes inconsistencies between the 305(b) report and the 303(d) list that is presented to the public in an integrated format in even-numbered years.

Data Quality Assurance and Quality Control

To ensure the quality of the data used in IDEM's 305(b) assessments, all surface water monitoring is conducted in accordance with IDEM's Quality Assurance Project Plan (QAPP) for Indiana Surface Water Quality Monitoring and Total Maximum Daily Load (TMDL) Program, which is part of the IDEM's overall Quality Management Plan (QMP), approved by USEPA. IDEM's QAPP for surface water monitoring was most recently revised in October 2004 and complies with the 2002 USEPA Guidance for Quality Assurance Project Plans (USEPA, 2002).

The QAPP outlines specific data quality objectives for environmental data and serves as a tool and provides a plan for environmental data collection for several surface water quality monitoring and TMDL programs. Additionally, the QAPP describes a well-defined data quality assessment (DQA) process for reviewing analytical data and categorizing analytical results in one of four levels of data quality. These data quality levels are used to determine the usability of the data for water quality assessments and other decisions.

IDEM's Water Quality and Assessment Data Management

The IDEM AB maintains its surface water quality data in its AIMS database. AIMS houses surface water chemistry, fish community, macroinvertebrate community, habitat quality, fish tissue contaminant and sediment contaminant data. Results from the fixed station monitoring program that were collected prior to 1995 are also stored in USEPA's Storage and Retrieval system (STORET) for samples collected through 1995. Since STORET is not available for batch upload at this time, it is expected to be replaced with the new Water Quality Exchange (WQX). IDEM is currently planning modifications to the AIMS database that will allow updates of data through the WQX. This update will also provide for a more user-friendly interface, better access via the IDEM Intranet by all staff, and allow for storage of additional water quality data such as NPS project-collected data and third party datasets for potential use in assessing waters for the IR.

IDEM's Watershed Planning Branch maintains IDEM's Assessment Database (ADB). The ADB houses the CWA Section 305(b) assessment decisions that have been made on the basis of the results stored in AIMS. IDEM recently upgraded its ADB to a more recent version that better accommodates US EPA's IR format. However, the structure of the new ADB is very different than the structure of the ADB IDEM has used in previous cycles, requiring a significant amount of review to ensure that all assessment data was properly migrated. Although database maintenance is an ongoing task, it is anticipated that the review and corrections needed specifically as a result of IDEM's data migration will be complete by the 2010 cycle.

Waterbody assessment units (AU) in the IDEM ADB are assigned a unique identifier which is "keyed" to the National Hydrography Dataset (NHD) for the purposes of mapping. This "key" is called the Reach Index. When Indiana created its first Reach Index in 2002, most waterbodies in the state were assigned an assessment unit ID (AUID) based on the 14-digit watershed in which they were located. In most cases, each 14-digit watershed was assigned a single AUID regardless of how many individual streams were in the watershed. Therefore, an assessment of *any* stream would be applied to *all* the streams in the watershed regardless of where the sample was located or its relative representativeness to each stream. This problem was not preventable at the time because, while the reach indexing tool used to create Indiana's Reach Index had the capability to

split "watershed" segments into smaller AUs, the software had no built-in means for tracking changes in segmentation.

For the 2006 IR cycle, IDEM developed an administrative process for splitting stream segments into smaller AUs allowing for more accurate application of assessment data. This process has been refined somewhat for the 2008 cycle. However, the basic process for splitting AUs is the same. Changes in segmentation are considered on a case-by-case basis and are generally made either to accommodate a more accurate assessment or to correct an earlier assessment in which the data were inappropriately applied.

Segmentation changes are based on a combination of factors including primarily hydrology, similarities in land use and potential sources of impairment. Splitting AUs in this way allows IDEM to associate an identified impairment more accurately to the waterbody from which the sample was collected and to any others for which results are representative. When AUs are split, IDEM reevaluates any assessments made on the original AU along with any recent data that is available. This reassessment process ensures that the original assessment information is properly applied to the resulting new AUs. In most cases, the original assessment applies to only one or two of the resulting AUs with the remaining units are unassessed.

IDEM's methods for tracking changes in segmentation are still being refined. Per USEPA's request, IDEM now retires the original AUID for any AU that has been split to facilitate tracking.

It is important to note that while changes in segmentation – usually from one large AU to several smaller AUs – increase the number of impairments on the 303(d) list, they produce a more accurate representation of the number of stream miles impaired. IDEM recognizes the importance of accurate tracking in this regard, particularly when resegmentation results in changes to the total number of AUs and stream miles listed as impaired. A key for tracking all segmentation changes to date and the application of previous assessment information to the resulting new AUs in terms of their Consolidated Listing categories is provided in Appendix A.

In addition to splitting segments, the Reach Index must be updated to include a number of waterbodies that could not be indexed due to the spatial resolution of the NHD at the time the index was developed. At the time Indiana's Reach Index was created, the NHD was only available in 1:100,000 scale. Given this, a number of the state's first and second order streams and lakes that do not appear at this scale could not be indexed and are therefore not mappable using the current Reach Index. Today, the NHD is available in high resolution (1:24,000 scale) for the entire state of Indiana. In order to facilitate more accurate mapping of these and future assessments, IDEM has begun the ambitious process of revising its Reach Index to include all waters that appear in the high resolution NHD. Due to the complexity of this work and the enormous number of additional waterbodies that appear when mapping at high resolution, this is no small task. Once IDEM completes its revision of the Reach Index, all new AUs identified must then be incorporated into IDEM's ADB for assessment purposes.

With regard specifically to streams, in order to index new streams that appear at high resolution, the indexing for the entire watershed must be revisited. Those AUs that were originally comprised of all streams in a given watershed will necessarily have to be split into more representative reaches for assessment purposes. Once this process is complete for the entire state,

the need to split AUs on an assessment-by-assessment basis will be eliminated along with the difficulties associated with tracking such changes.

At this time, it is anticipated that IDEM's high resolution Reach Index will be completed prior to the 2010 integrated report cycle. In the meantime, IDEM has prioritized its high resolution indexing work to stay ahead of IDEM's monitoring and assessment schedule, focusing indexing efforts in those basins next in line for assessments in order to minimize the number of AUs split for assessment purposes.

Summary Data and Assessment Methodology

Summary Data

Indiana's CALM is provided in its entirety in Appendix A along with Indiana's Consolidated List. This section provides a summary of the data that supports IDEM's 305(b)/303(d) processes. IDEM draws from the following monitoring programs for data to use in making the use support determinations required under CWA Section 305(b) assessments and subsequent CWA Section 303(d) listing decisions:

- Fixed Station Monitoring Program, which provides chemistry data;
- Watershed Monitoring Program, which provides fish and benthic aquatic macroinvertebrate community data (IBI and mIBI) along with habitat evaluations, water chemistry data including information on nutrients, Chlorophyll *a* data, and *E. coli* data;
- Source ID Program, which provides chemistry data;
- Stressor ID Program, which provides fish community (IBI) data and habitat evaluations along with chemistry data collected at the same sites;
- Fish Tissue Contaminant Program, which provides fish tissue data;
- Lakes Monitoring Program, which provides chemistry data and information on nutrients, algae, secchi depth; and
- Special Studies Program which provides a variety of information for selected locations.

SWQMS and fact sheets with detailed descriptions of the monitoring programs are available on the IDEM Web site at: http://www.in.gov/idem/programs/water/quality/index.html

USEPA requires that states consider all readily available data sources in the preparation of their 303(d) lists and thus the 305(b) assessment purposes. In addition to the water quality data collected by IDEM, IDEM has cooperative agreements with the USGS to collect water quality data at the same sites sampled by IDEM to provide data for additional parameters not sampled by IDEM. In addition to providing important data for IDEM's development of its nutrient criteria, these data can also be used in 305(b) assessments and 303(d) listing decisions. IDEM also routinely solicits data generated by external parties through 319 and 205(j) grant projects for potential use in 305(b) assessments. IDEM's 305(b) coordinator also works closely with TMDL staff to determine whether data they collect for TMDL development from external parties can be used in making water quality assessments. Although these data are collected by organizations external to IDEM, most of these data sets are submitted to IDEM and housed internally making them most easily obtainable through program staff within IDEM. All data received are reviewed for usability in accordance with IDEM's Assessment Branch QAPP.

While IDEM works with external organizations to obtain water quality data for potential use in water quality assessment processes, the ability to solicit the largest possible audience and to review the data received has been hampered in past cycles by the lack of a formal process and limited staff resources. In order to address these issues, IDEM OWQ has begun developing a framework for the solicitation, review of external data for its usability in selected OWQ programs. The goals of this project include:

- Identifying IDEM processes for which external organizations would like to see their data used (e.g. education, planning, TMDL development, 305(b) assessment, 303(d) listing, etc.);
- Developing an effective data solicitation process;
- Developing a data quality ranking system and criteria specific for each type of proposed use;
- Developing a process for providing technical assistance to help organizations meet the data quality criteria necessary for the process in which they want their data considered.

In 2007, it was determined that a broad data solicitation prior to having the external data framework fully developed would provide a fuller understanding of the variety of organizations that are collecting water quality data in Indiana, the types of data they are collecting and its relative data quality. IDEM solicited data from:

- Relevant programs at every college and university in the state
- Environmental groups and interested citizens identified through various sources
- Hoosier Riverwatch - Indiana's statewide volunteer monitoring program
- Drinking water utilities
- County health departments and the ISDH
- County SWCD (via IASWCD)
- Municipal Separate Storm Sewer System (MS4) entities and Combined Sewer Overflow (CSO) communities
- Federal agencies (USGS, USFS, etc.)
- State professional organizations (Indiana Water Resources Association., Indiana Association of Cities and Towns, etc.)

Results from this solicitation have also helped to identify where IDEM should focus its solicitation and technical assistance efforts to achieve a greater response from the water quality monitoring community at large. In total, IDEM sent solicitations by email or letter to approximately 670 individual organizations that fall into one or more of the categories in the above list. A copy of this solicitation is provided in Appendix F of this report. In response to this solicitation, IDEM received more than one hundred water quality data packages and reports from forty-one individual organizations. A summary of the types of organizations that responded with data is provided below in Table 6.

Table 6: Summary of results from IDEM's external data solicitation, conducted in 2007.

Type of Organization	Number that Submitted Data
Cities and Towns	14
County Soil and Water Conservation Districts (SWCD)	8
Watershed Groups and Environmental Organizations	6
County Health Departments	5
Colleges and Universities	2
Private Drinking Water Utilities	1
County Surveyors	1
Resource Conservation and Development Areas (RC&D)	1
Regional Planning Commissions	1
Parks and Recreation Departments	1
Other State Agencies	1

The chemical and physical data sets received from the 2007 solicitation are presently being reviewed to determine their usability in IDEM's 305(b)/303(d) processes and to synthesize the information they contain relative to the development of IDEM's external data framework. IDEM is also reviewing projects conducted with funding from IDNR Lake and River Enhancement Program and projects funded through IDEM's Section 319 and 205(j) programs. Any 305(b) assessment decisions made from these data will be incorporated into IDEM's 305(b) electronic update submitted to USEPA in 2009 and will be discussed in more detail in IDEM's narrative IR submitted in 2010.

IDEM has completed its review of the biological data submitted and has determined that studies submitted by two organizations, the City of Muncie and the City of Elkhart meet IDEM's quality assurance requirements and are readily available and usable in their present form for 305(b) assessment and 303(d) Listing processes. The other studies submitted contain valuable information for IDEM biologists and were considered generally usable with respect to the data quality (Table 7). However they will require significant staff time to prepare them for assessment purpose. IDEM is highly encouraged by the results of its preliminary review and the quality of the data received. As IDEM moves forward with its External Data Framework Project, all data will be reevaluated to determine what improvements IDEM needs to make in terms of communicating its format requirements for data submissions. As with chemical data sets received, those biological data sets determined to be usable for assessment purposes will be assessed and incorporated into IDEM's 305(b) electronic update submitted to USEPA in 2009.

They will be discussed in more detail in IDEM's narrative IR submitted in 2010.

Table 7: Review results for biological data sets reviewed in response to 2007 solicitation.

Organization	Type of Data Submitted	Usability in IDEM Assessment Processes
City of Elkhart	Macroinvertebrate Community Fish Community Fish Tissue	Datasets are usable in their present format for assessment purposes. These studies were found to have high precision and taxonomic sensitivity with the survey and assessment having been conducted by a professional biologist
City of Muncie	Macroinvertebrate Community Fish Community	Datasets are usable in their present format for assessment purposes. These studies were found to have high precision and taxonomic sensitivity with the survey and assessment having been conducted by a professional biologist
Marion County Health Department	Macroinvertebrate Community	These studies appear to have high precision and taxonomic sensitivity with the survey and assessment having been conducted by a professional biologist. However, the data set is very large with no analysis provided. Due to the significant time required to work through the raw data to prepare them for assessments (mapping, evaluation and interpretation), they are not presently considered readily available for assessment purposes.
Storm Water Quality Management Plans Baseline Characterization Reports: • City of Shelbyville • City of Madison • City of Decatur • Town of Speedway	Macroinvertebrate Community	These studies were found to have high precision and taxonomic sensitivity with the survey and assessment having been conducted by a professional biologist as required by IDEM's QAPP. However, the rapid bioassessment (RBP) tool used to analyze results is different than that which IDEM uses, making it difficult to interpret. Generally these data are usable for assessment purposes. However, due to the staff time required to determine comparability, they are not presently considered readily available for assessment purposes.

It is anticipated that OWQ's external data framework will ultimately provide the guidelines and technical assistance necessary to help organizations collecting water quality data throughout Indiana who desire the opportunity to become more involved with IDEM in working toward our shared goals of protecting and restoring Indiana's water resources.

Assessment Methodology

Waterbodies in this report are identified based on watershed areas known as 14-digit hydrologic unit areas (HUAs), which in Indiana range from about 5,000 to 20,000 acres in size. The average 14-digit hydrologic unit area in Indiana is about 12,000 acres or 20 square miles. As discussed in earlier sections of this report, in Indiana's Reach Index, a waterbody AU may represent separate reaches or the whole mainstem of the larger waterbody and/or its tributaries within a 14-digit watershed. Beginning with the 2006 assessment cycle, IDEM began splitting AUs for assessment

purposes. As a result, in the basins assessed during this cycle there is an increasing number of 14-digit watersheds in which each individual stream is assigned its own unique AUID. While this practice will necessarily continue in the long term, generally, the river miles in most watersheds still appear as one waterbody. However, in watersheds containing reaches of Indiana's large rivers (i.e. rivers with more than 1,000 square miles of drainage area), these reaches were already assigned individual AUIDs and rarely require splitting for assessment purposes. The waterbody AUs for these reaches typically do not include tributaries. This approach allows IDEM to separate wadeable streams from nonwadeable streams for the purposes of assessment ensuring that issues such as sampling techniques, which might bias results, are considered within the context of stream size. All waterbody assessments for Indiana's hydrologic unit areas are now stored in the database.

Indiana's lakes and reservoirs are tracked as individual waterbodies and are reported in terms of their acreage with the hydrologic unit area in which they are located. Lake Michigan is tracked both as Great Lake shoreline miles and as a lake in acres with its own USGS cataloging unit (eight-digit hydrologic unit code). The shoreline is assigned mileage units. Lake Michigan is assigned acreage units and is not included in the lake acre assessment values in this report. Separate tracking of Lake Michigan will lead to better assessment and understanding of the water quality of this lake.

The assessment process described in Indiana's CALM (Appendix A) is summarized in Table 8 and was applied to data from various programs in IDEM's AB and to other external data meeting IDEM's QAQC requirements. Results from the assessment process are entered into IDEM's ADB. Site-specific assessments that are entered into the ADB are presented in Appendix A, which includes all assessments completed to date for each waterbody by their beneficial uses: aquatic life support, fish consumption, recreational use, and drinking water supply for those waterbodies designated for this use. Each unique waterbody AU for which data was collected received its own assessment. As discussed earlier in this report, when the assessment for a AU was not homogeneous, the AU was split into smaller AUs, each assessed separately.

Physical/chemical data for toxicants (total recoverable or dissolved metals, polynuclear aromatic hydrocarbons [PAHs], pesticides, ammonia, and cyanide), conventional water chemistry parameters (dissolved oxygen, pH, temperature, and anions), and bacteria (*E. coli*) were evaluated for exceedance of the Indiana WQS (327 IAC 2-1-6 and 327 IAC 2-1.5-8). USEPA 305(b) Guidelines were applied to sample results as indicated in Table 8 (USEPA 1997b).

Table 8: Summarized Criteria for Use Support Assessment.

<table>
<tr><th colspan="3">Aquatic Life Use Support - Rivers and Streams</th></tr>
<tr><td rowspan="3">Toxicants</td><td colspan="2">Metals, pesticides, PAHs, cyanide, ammonia were evaluated on a site-by-site basis and judged according to the magnitude of the exceedance(s) of Indiana's WQS and the number of times the exceedance(s) occurred. For any one pollutant (grab or composite samples), the following assessment criteria are applied to data sets consisting of three (3) or more measurements.</td></tr>
<tr><th>Fully Supporting</th><th>Not Supporting</th></tr>
<tr><td>≤1 exceedance of the acute criteria within a three-year period, and <1 exceedance of the chronic criteria for aquatic life within a three-year period.</td><td>>1 exceedance of the acute or chronic criteria for aquatic life within a three-year period.</td></tr>
<tr><td rowspan="3">Conventional inorganics</td><td colspan="2">Dissolved oxygen, pH, sulfates, chlorides were evaluated for the exceedance(s) of Indiana's WQS. For any one pollutant, the following assessment criteria are applied to data sets consisting of three or more measurements.</td></tr>
<tr><th>Fully Supporting</th><th>Not Supporting</th></tr>
<tr><td>For dissolved oxygen, one/more samples may be <4mg/L, but no more than 10% of all measurements are <5mg/L. For other conventional inorganics, criteria are exceeded in <10% of measurements.</td><td>For dissolved oxygen, one/more samples <4mg/L and more than 10% of all measurements are <5mg/L. For other conventional inorganics, criteria are exceeded in >10% of measurements.</td></tr>
<tr><td>Nutrients</td><td colspan="2">Nutrient conditions were evaluated on a site by site basis using the benchmarks described below. In most cases, two or more of these conditions must be met on the same date in order to classify a waterbody as impaired. This methodology assumes a minimum of three sampling events.
Total Phosphorus: One/more measurements >0.3 mg/l
Nitrogen (measured as $NO_3 + NO_2$) -- One/more measurements >10.0 mg/l
Dissolved Oxygen (DO) -- Measurements below the water quality standard of 4.0 mg/l or measurements that are consistently at/close to the standard, in the range of 4.0-5.0 mg/l or values >12.0 mg/l
pH measurements -- Measurements above the water quality standard of 9.0 or measurements that are consistently at/close to the standard, in the range of 8.7- 9.0
Algal Conditions -- Algae are described as "excessive" based on field observations by trained staff.</td></tr>
</table>

Benthic aquatic macroinvertebrate Index of Biotic Integrity (mIBI) Scores (Range of possible scores is 0-8)	**Fully Supporting**	**Not Supporting**
	• mIBI ≥1.8 (for samples collected with an artificial substrate sampler) • mIBI ≥2.2 (for samples collected using kick methods)	• mIBI <1.8 (for samples collected with an artificial substrate sampler) • mIBI <2.2 (for samples collected using kick methods)
Fish community (IBI) Scores (Range of possible scores is 6-60)	IBI ≥36	IBI <36
Qualitative habitat use evaluation (QHEI) (Range of possible scores is 0-100)	The Qualitative Habitat Evaluation Index (QHEI) is not used to determine aquatic life use support. Rather, the QHEI is an index designed to evaluate the lotic habitat quality important to aquatic communities and is used in conjunction with mIBI and/or IBI data to evaluate the role that habitat plays in waterbodies where impaired biotic communities (IBC) have been identified. QHEI scores are calculated using six metrics: substrate, instream cover, channel morphology, riparian zone, pool/riffle quality, and gradient. A higher QHEI score represents a more diverse habitat for colonization of aquatic organisms. IDEM has determined that a QHEI total score of <51 indicates poor habitat. For streams where the macroinvertebrate and/or fish community (mIBI and/or IBI) scores indicate IBC, QHEI scores are evaluated to determine if habitat is the primary stressor on the aquatic communities or if there may be other stressors/pollutants causing the IBC.	
Aquatic Life Use Support – Lakes and Reservoirs		
Indiana Department of Natural Resources surveys of the status of sport fish communities in lakes and information on trout stocking.	**Fully Supporting**	**Not Supporting**
	Supports cold water fishery, including native cisco and stocked trout, or both.	Native cisco population is gone or lake unable to support stocked trout and lake attributes, or both, appear to contribute to warm water fishery condition.
Temperature and pH	Lakes in which thermal modifications have caused an adverse effect on aquatic life and lakes that do not meet Indiana's WQS for pH have been assessed as not supporting of aquatic life use.	
Fishable Use Support (Human Health)		
Available fish tissue data for the most recent 12 years of data collection were evaluated for 305(b)/303(d) purposes for the 2008 cycle. Only waters for which sufficient fish tissue data were available were assessed for fish consumption All samples from a given sampling reach must have results below the benchmarks for mercury and PCBs in order to be assessed as fully supporting, and all waters with a sample result exceeding the benchmark for either mercury and/or PCBs are classified as impaired.		

	Fully Supporting	Not Supporting
Mercury in Fish Tissue	Actual concentration values (including estimated values above the method detection limits) for all samples collected from sampling reach are ≤0.3 mg/kg	One or more actual concentration values (including estimated values above the method detection limits) for samples collected from sampling reach are >0.3 mg/kg
	Fully Supporting	**Not Supporting**
PCBs in Fish Tissue	Actual concentration values (including estimated values above the method detection limits) for all samples collected from sampling reach are ≤0.02 mg/kg	One or more actual concentration values (including estimated values above the method detection limits) for samples collected from sampling reach are >0.02 mg/kg

Recreational Use Support (Human Health) – All waters

IDEM has two different criteria for recreational use assessments depending on the type of data set being used in making the assessment. For data sets consisting of five equally spaced samples over a 30-day period, we apply two tests, both of which are based on USEPA's Ambient Water Quality Criteria for Bacteria - 1986 (EPA440/5-84-002), which provides the foundation for Indiana's WQS for recreational use. For data sets consisting of 10 or more grab samples where no five of which are equally spaced over a 30-day period, the 10% rule is applied. Specific criteria are provided below.

	Fully Supporting	Not Supporting
Bacteria (E. coli): at least five equally spaced samples over 30 days. (cfu = colony forming units)	Geometric mean does not exceed 125 cfu/100ml and no more than one sample >576 cfu/100ml.	Geometric mean exceeds 125 cfu/100mL.
Bacteria (E. coli): grab samples (cfu = colony forming units)	No more than 10% of measurements >576 cfu/100ml and not more than one sample >2400 cfu/100ml.	More than 10% of samples >576 cfu/100ml or more than one sample >2,400 cfu/100ml.

Drinking Water Use Support – Rivers

Rivers are designated for drinking water uses if a community water supply has a drinking water intake somewhere along the segment. When IDEM has data for a segment with a drinking water intake, those data are compared to Indiana's WQS to determine if the drinking water use is met. Different criteria are applied depending on whether the segment is located within or outside of the Great Lakes system. The appropriate water quality criteria are applied for specific substances identified in the criteria. Information regarding non-naturally occurring taste and odor producing substances not specifically identified in the criteria are reviewed within the context of a water treatment facility's ability to meet Indiana's drinking WQS using conventional treatment.

<table>
<tr><td rowspan="3">Toxicants</td><td colspan="2">Metals, pesticides, PCBs, total cyanide were evaluated on a site by site basis and judged according to magnitude of the exceedance(s) of Indiana's WQS for point of water intake and the number of times exceedance(s) occurred. For any one pollutant (grab or composite samples), the following assessment criteria are applied.</td></tr>
<tr><td>Fully Supporting</td><td>Not Supporting</td></tr>
<tr><td>No more than one exceedance of the acute or chronic criteria for human health within a three-year period.</td><td>More than one exceedance of the acute or chronic criteria for human health within a three-year period.</td></tr>
<tr><td rowspan="3">Conventional inorganics</td><td colspan="2">Total dissolved solids, specific conductance, sulfate, chloride, nitrite-N and nitrogen (measured as $NO_3 + NO_2$) were evaluated for the exceedance(s) of Indiana's WQS for point of water intake and the number of times the exceedance(s) occurred. For any single pollutant (grab or composite samples), the following assessment criteria are applied to data sets consisting of three or more measurements.</td></tr>
<tr><td>Fully Supporting</td><td>Not Supporting</td></tr>
<tr><td>No more than one exceedance of the acute or chronic criteria for human health within a three-year period.</td><td>More than one exceedance of the acute or chronic criteria for human health within a three-year period.</td></tr>
<tr><td rowspan="2">Taste and odor producing substances</td><td>Fully Supporting</td><td>Not Supporting</td></tr>
<tr><td>Taste and odor substances not present in quantities sufficient to interfere with production of drinking water by conventional treatment</td><td>Taste and odor substances present in quantities requiring additional treatment by the public water supply to prevent taste and odor problems</td></tr>
<tr><td colspan="3">Recreational Use Support (Aesthetics) – Lakes and Reservoirs</td></tr>
<tr><td rowspan="2">Natural Lakes</td><td>Fully Supporting</td><td>Not Supporting</td></tr>
<tr><td>No more than 10% of all TP values >54 ug/L and their associated Chla values are <20ug/L</td><td>Less than 10% of all TP values are <54 ug/L but their associated Chla values are >20ug/L, and the TSI score for the lake indicates eutrophic (32-46) or hypereutrophic (>47) conditions

Or

More than 10% of all TP values are >54 ug/L with associated Chla values <4ug/L, but the TSI score for the lake indicates eutrophic (32-46) or hypereutrophic (>47) conditions

Or

More than 10% of all TP values are >54 ug/L with associated Chla values >4ug/L</td></tr>
</table>

	Fully Supporting	Not Supporting
Reservoirs	No more than 10% of all TP values >51 ug/L and their associated Chla values <25ug/L	Less than 10% of all TP values are <51 ug/L but their associated Chla values are >25 ug/L and the TSI score for the lake indicates eutrophic (32-46) or hypereutrophic (>47) conditions Or More than 10% of all TP values are >51 ug/L with associated Chla values <2ug/L, but the TSI score for the lake indicates eutrophic (32-46) or hypereutrophic (>47) conditions Or More than 10% of all TP values are >51 ug/L with associated Chla values >2ug/L
Drinking Water Use Support – Lakes and Reservoirs		
Information on the application of pesticides to surface drinking water reservoirs	Reservoirs or lakes that serve as source water for public water supplies that received pesticide (algaecide) application permits for algae were classified as not supporting because additional treatment by the public water supply was required to prevent taste and odor problems.	
Other Assessments – Lakes and Reservoirs		
Indiana Trophic State Index (TSI)	Nutrients, ammonia, dissolved oxygen, light transmission and light penetration in the water column turbidity, and algae growth were used to determine TSI scores. Trophic scores were used to classify lakes according to their trophic state. Lake trends were also assessed for lakes with two or more trophic scores if at least one of the scores was less than five years old. Trophic scores and lake trends are not used to determine use support status. These assessments are conducted to fulfill Clean Water Act Section 314 reporting requirements for publicly owned lakes and reservoirs.	

In addition to the decision- making criteria show in Table 8, the need for a Coolwater Index of Biotic Integrity (IBI) has been recognized. IDEM has been working with the Aquatic Research Center of the Indiana Biological Survey (INBS) on creating an Index of Biotic Integrity for coolwater streams. A total of 283 sites were examined statewide in order to develop and calibrate an Index of Biotic Integrity for use in coolwater streams of Indiana. A coolwater temperature model was created from 34 streams that had daily temperatures less than 26 Celsius. Graphical analysis of the data from the Aquatic Research Center of the INBS enabled construction of maximum observed species lines for calibrating the Coolwater Index of Biotic Integrity for twelve metrics as modified for application to all coolwater streams and rivers in Indiana. Metrics that have been previously calibrated in ecoregions and other reports have been modified for the Coolwater IBI. By evaluating the 303(d) listed streams against the coolwater temperature model, about 18% of the failing streams actually were misclassified coolwater streams and met the revised criteria. Both the INBS and IDEM AIMS fish databases were used for the development of the new IBI. This data, while not an actual assessment, is important as it points to possible

changes needed to the water quality standards. In the future, IDEM will explore the possible addition of a cool water designation for streams, in addition to the current warm water and cold water designations.

List of Impaired Waters

IDEM OWQ began using the integrated reporting format in 2002. This format calls for the development of two lists, both of which are included in this report. Indiana's Consolidated List contains assessment information for all waters of the state, which is developed to fulfill CWA Section 305(b) requirements. The 303(d) List of Impaired Waters is a subset of the Consolidated List and identifies only those waters that are impaired and for which a TMDL is required per CWA Section 303(d).

A draft list for 2008 was prepared and published in the Indiana Register on September 26, 2007. Public comments were accepted through January 31, 2008, on the draft list. The draft list and public comment period notice is available on the Office of Water Quality Internet site:

http://www.in.gov/idem/programs/water/303d/index.html

The final 2008 Section 303(d) List of Impaired Waters is included in Appendix A of this report. For the development of the 2008 303(d) list, IDEM has followed, to the degree possible, the 305(b) and 303(d) reporting methods outlined in the U.S. EPA's *Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act* (USEPA, 2005) and the additional guidance provided in the U.S. EPA memorandum *Information Concerning 2008 Clean Water Act Sections 303(d), 305(b), and 314 Integrated Reporting and Listing Decisions* (USEPA, 2006b). This guidance recommends that each waterbody be placed into one of five categories (or their subcategories) depending on the degree to which it supports its designated uses. Waters in Category 5 require TMDLs and are the Section 303(d) Impaired Waters. A more detailed discussion of the consolidated listing methodology and the different categories illustrated in Figure 5 can be found in Appendix A of this report.

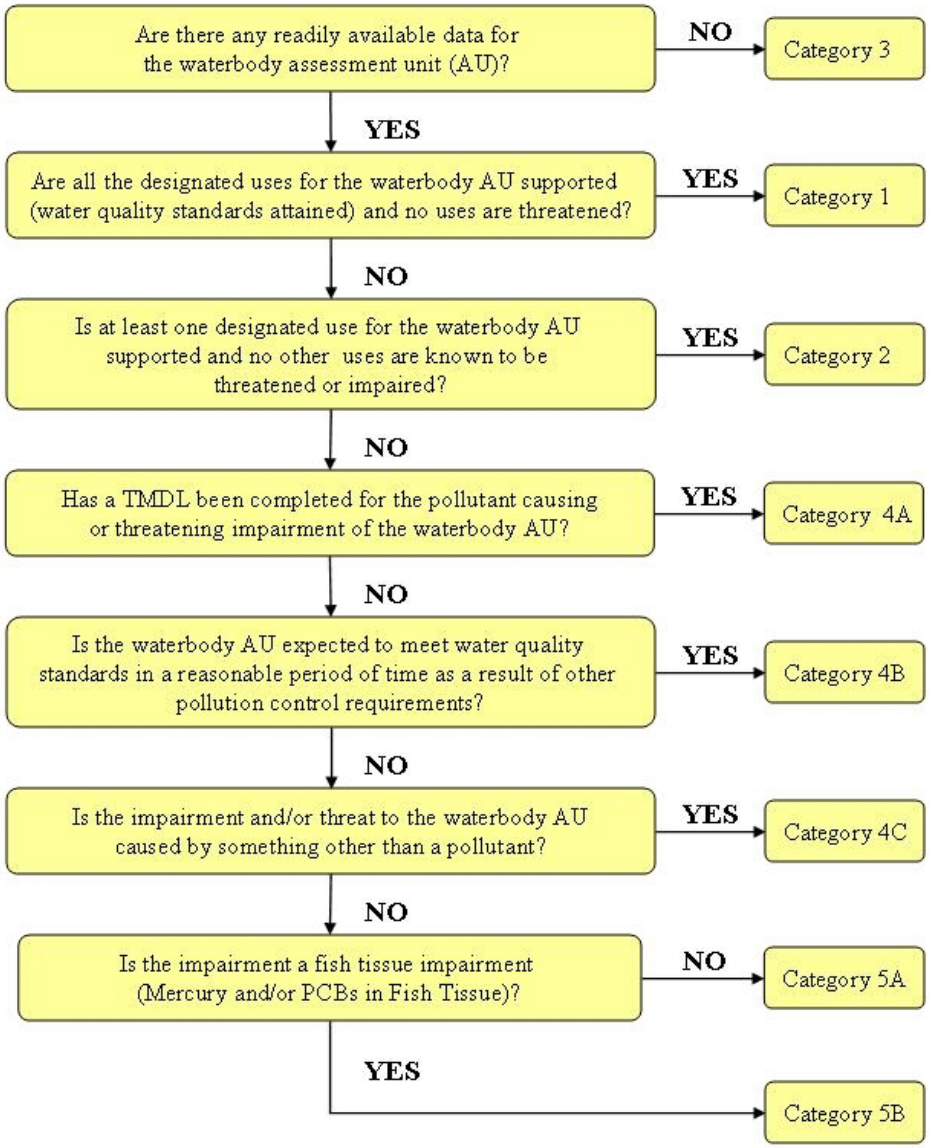

Figure 5: Consolidated Listing Logic Diagram

Rivers and Streams Water Quality Assessment

Designated Use Support

Rivers and streams in all watersheds were assessed for support of beneficial uses designated in Indiana WQS (Indiana Legislative Services Agency, 1997), which contain both narrative and numeric requirements to ensure that beneficial uses of Indiana waters are protected. Indiana's WQS provide the basis for IDEM's CWA Section 305(b) water quality assessments. Of the beneficial uses designated in the State's WQS, IDEM assesses aquatic life use support, recreational use support, support of "fishable" uses. IDEM also assesses drinking water use support on surface waters that serve as a public water supply. Although there are additional uses designated in Indiana's WQS, IDEM's limits its assessments to these four uses because the criteria in place to protect them are more stringent than those necessary to protect other uses. Thus, by protecting for these four uses, other uses such as agricultural and industrial uses are supported.

A summary of IDEM's methods for determining support of designated uses is provided in the Assessment Methodology and Summary Data Section, and IDEM's CALM is provided in its entirety in Appendix A of this report. For the 2008 cycle, IDEM began using fish tissue data directly to make assessments for PCBs and mercury in fish tissue, both of which are bioaccumulative chemicals of concern. These assessments are made in keeping with the narrative part of Indiana's WQS that are intended to protect the "fishable" uses of waterbodies throughout the state.

In previous years, IDEM relied on fish consumption advisories (FCA) published by the ISDH to assess the fishable uses of Indiana waters. Despite the fact that FCA are not tied to any numeric WQS, USEPA required their use for CWA 305(b) assessments because, at the time, the FCA provided the best information available to assess for support of fishable uses. Since then, USEPA has developed appropriate screening value calculations that allow states to relate WQS to PCB concentrations in fish tissue. USEPA has also developed a national water quality criterion for mercury in fish tissue.

The FCA are not based on WQS, which are intended to provide the underpinning for CWA 305(b) assessments and 303(d) decisions. Like the FCA, the criteria now used to make fishable use support assessments these criteria are intended to be protective of human health. Unlike the FCA, these criteria are directly related to WQS and provide a more accurate and complete assessment of where high concentrations of these contaminants are found in the aquatic environment. Because FCA are expressed only in terms of certain fish species within a given size class, they do not tell the whole story. Comparing fish tissue data directly to a numeric criterion, regardless of the species sampled or their sizes, provides a more accurate assessment of the resource and is thus more consistent with CWA goals.

IDEM's revised methodology was implemented by conducting a statewide reassessment of all lakes and streams in the state for which IDEM had sufficient fish tissue data to make an assessment. The results of this reassassement are presented in this report, stream results in this section and lakes results in the section entitled, "Lake Water Quality Assessment". This reassessment process and IDEM's revised method for fish tissue assessments and the rationale

for revising the methods are discussed in detail in IDEM's CALM provided in Appendix A of this document.

Assessed waters are those waterbodies that were monitored and classified for use support based on IDEM's assessment results. IDEM's SWQMS provides for monitoring all the state's major basins within a five-year period. Therefore, the data used in assessments generally are five years old or less. The results of IDEM's Comprehensive Use Support Assessments are provided in Appendix C.

Waterbodies are classified for designated use support as described in the Assessment Methodology Section. Support of individual designated uses for the state's waterbodies is determined by adding the stream miles assessed for each use individually. Table 9 summarizes use support for the stream miles in the state.

Table 9: Individual Use Support Summary – Streams.

Designated Beneficial Use	Total Miles Designated	Miles Assessed	Percent Assessed	Miles Fully Supporting	Miles Not Supporting
Aquatic Life Use	32,141	17,535	54.6	13,913	3,622
Fishable Uses	32,170	4,465	13.9	1,044	3,420
Drinking Water Supply	102	1	1.0	0	1
Recreational Use (Human Health)	32,173	12,073	37.5	3,700	8,374

Causes/Stressors and Sources of Impairment of Designated Uses

Causes/stressors are those pollutants or other stressors that contribute to the actual or threatened impairment of designated uses in a waterbody. Toxic substances listed in the state water quality numeric standards and conditions such as habitat alterations, presence of exotic species, etc. are all examples of causes or stressors. The stressor inhibits the waterbody from providing a habitat that can support aquatic life or creates a situation that is hazardous to human health or animal life.

Table 10 represents the total miles of streams affected by each cause/stressor in Indiana. A waterbody may be impaired by several different causes/stressors so that the total stream miles affected may actually be less than the total number of miles listed in the table.

Biotic community status represents streams where the cause of impairment is not identified. The fish and/or benthic macroinvertebrate community at sampling sites in the watershed have responded to as yet unidentified stressors.

Table 10: Summary of National and State Causes Impairing Waters – Streams.

Source: Indiana 305(b) Assessment Database

Sources are the activities that contribute pollutants or stressors to surface water resulting in impairment of designated uses in a waterbody. The structure of IDEM's Assessment Database (ADB), which was designed by USEPA for states to use in their CWA section 305(b) reporting, requires that a source be identified for each assessment made whether or not specific sources are precisely known. For most assessments, the sources identified in the ADB for a given

impairment are not proven. Rather they represent those sources determined by IDEM staff to be the most likely sources given a variety of factors, including but not limited to:

- Land uses (as indicated by field observations and land use data from published sources such as GAP, L-Thia, areal photography, etc.);
- Field observations of potential sources such as illegal straight pipes, tillage to the stream's edge, livestock in the stream, etc;
- The presence of permitted facilities within close proximity of the impaired stream in cases where the impairment is something that could reasonably be expected to be associated with the discharge of those facilities;
- Naturally occurring conditions that could contribute to impairment.

IDEM believes that by using best professional judgment, its scientists can apply these types of information to distinguish the most likely sources of impairment in the watershed, providing a starting point for a TMDL, watershed planning or other activities aimed at restoring the stream. Within this context, the sources identified in the ADB do not identify any entities or practices known to contribute to a specific impairment.

Absent more detailed and resource-intensive sampling and analyses, accurately attributing a given impairment to specific sources is difficult at best and is, in many cases, impossible to do with a high degree of certainty. In 2004, IDEM implemented a second-year sampling strategy to address this issue. IDEM's second-year studies are aimed at providing sufficient data to more confidently attribute specific sources to impairments than previously possible.

IDEM continues to explore different approaches to determine sources of impairments. One approach involves gathering a variety of information from sources within and outside IDEM to determine extent of problem area and potential sources/stressors of the impairment. When sufficient information is gathered to characterize the impairment, all the data are analyzed to narrow down the list of potential sources/stressors and identify those contributing to the impairment. The potential of these sources to contribute to the identified impairment is then verified and a sampling plan is developed to collect any additional biological and/or chemical water quality data needed to confirm or eliminate the potential sources identified.

The activities listed in Table 11 represent the total stream miles impaired due to each potential source. Several potential sources may contribute to impairment of a single stream or stream reach, so the total miles in the table may be greater than the actual stream miles impaired reported elsewhere in this document.

Table 11 includes 45 potential sources for the use impairments shown in Table 11, including agricultural categories and additional sources resulting from urban activities and land development. Illicit connections identify "straight pipes" from buildings in unsewered areas that flow into state waters without any treatment. Contaminated sediments are largely due to PCBs that correlate with elevated PCB levels in fish tissue.

Great Lakes Shoreline Water Quality Assessment

The Indiana portion of Lake Michigan is classified as partially supporting recreational use. The shoreline miles reported in Tables 12 through 14 represent linear shoreline miles.

With the exception of Lake Michigan, which is discussed in the next section, Indiana's lakes are assessed for support of designated uses as described in the Lake Water Quality Assessment section of this report. Indiana's entire portion of the Lake Michigan shoreline was assessed in 2001.

Table 12: Individual Use Support Summary – Great Lakes Shoreline.

Designated Beneficial Use	Total Miles Designated	Miles Assessed	Percent Assessed	Miles Fully Supporting	Miles Not Supporting
Aquatic Life Use	59	59	100	59	0
Fishable Uses	59	59	100	0	59
Drinking Water Supply	33	33	100	33	0

Great Lake Water Quality Assessment – Lake Michigan

The Indiana waters of Lake Michigan have been assessed for mercury and PCBs in fish tissue as per IDEM's 2008 Consolidated Assessment and Listing Methodology. Tables 15 through 17 reflect the results of these assessments. Lakes are assessed as a single unit; therefore, any impairment will apply to all 154,176 acres of Lake Michigan.

Table 15: Individual Use Support Summary – Lake Michigan.

Lake Water Quality Assessment

Because of the differences in the scope and nature of the data collected on Indiana's lakes as opposed to the state's rivers and streams, there is generally less information available with which to make assessments. The criteria for use support assessments for lakes and reservoirs is presented in Table 8 and discussed in more detail here and in the section on the Indiana Clean Lakes Program. Summaries of 305(b) assessment information for Indiana lakes are provided in Tables 18 through 20.

Designated Use Support

Monitoring for CWA Section 305(b) designated use support assessments of Indiana lakes has been limited in the past because the majority of State resources allocated for lakes have gone toward assessing the trophic status of lakes in the state pursuant to CWA Section 314.

IDEM uses Indiana's Trophic State Index (TSI) to make its CWA Section 314 assessments. Although TSI calculations take into account results for water quality indicators such as nutrients, dissolved oxygen, water clarity, and plankton, the TSI score alone is considered insufficient for judging the condition of biological communities such as fish, macroinvertebrates, and plant life for the purposes of Section 305(b) assessments of aquatic life use support.

IDEM has used biological indicators to determine aquatic life use support in rivers and streams for many years. However, IDEM has comparatively little biological community data for Indiana lakes. Given this, Section 305(b) aquatic life use assessments have relied on information primarily from the IDNR:

- Information regarding the presence or absence of the native cold water cisco (*Coregonus artedi*) as indicated in IDNR's surveys of sport fish communities was used to determine whether a given lake is fully supporting aquatic life use or impaired, respectively.
- In keeping with Indiana's narrative WQS, those waters stocked for the purposes of put-and-take trout fishing as indicated by IDNR's trout stocking plans were assessed as fully supporting.

In cases where temperature and pH information are available and indicate an adverse affect on the aquatic life, the lake was assessed as impaired.

Between 1999 and 2004, IDEM commissioned two studies aimed at developing indices of biological integrity for Indiana lakes. The first study focused on northern Indiana lakes and reservoirs, and the second focused on lakes in the southern part of the state. Both studies were funded under CWA Section 319 grants to the Indiana Lakes Management Society and were conducted by Dr. Thomas Simon of the INBS.

These studies resulted in the development, calibration, and subsequent validation of an IBI for northern lakes and reservoirs and an IBS (Index of Biological Sustainability) for southern lakes and oxbows. IDEM is presently reviewing the results to determine whether they can be used to assess aquatic life use in the waterbodies sampled and the extent to which the indices developed can be incorporated into IDEM's CALM.

The degree to which Indiana's lakes support their "fishable" uses as described in Indiana's narrative WQS are assessed using fish tissue contaminant data. Presently, IDEM assesses for mercury and PCBs in fish tissue. Details regarding IDEM's fish tissue assessment methodology can be found in IDEM's Consolidated Assessment and Listing Methodology in Appendix A of this report.

IDEM conducts two types of recreational use support assessments on lakes. For the 2008 cycle, IDEM developed a new methodology to assess recreational uses specifically within the context of aesthetics. This method employs benchmarks for total phosphorus concentrations for both natural lakes and reservoirs that have been found to result in significant increases in algal levels. Because excessive algae can deter use of the resource for recreational purposes, these criteria are used to make recreational use support determinations only and are made within the context of aesthetics as opposed to health risk. Details regarding the development of this methodology and how it was applied are provided in IDEM's CALM (Appendix A).

Recreational Use Support assessments within the context of human health are based on pathogen data and are made in the same manner as for rivers and streams when adequate data are available.

Drinking water use support for lakes and reservoirs is limited to those that are used directly or indirectly as drinking water supplies. Lakes and reservoirs for which water utilities have applied for pesticide application permits from IDEM's Drinking Water Branch were assessed as not supporting of their drinking water use. Conditions that require the application of pesticides to a drinking water supply to control algal levels in excess of those that are naturally occurring are considered an impairment of the Indiana's narrative WQS for taste and odor producing substances.

Blue-green algae (cyanobacteria) continue to be a concern in Indiana lakes and reservoirs both with respect to recreational uses and drinking water uses. The presence of the exotic and potentially toxic blue-green algae, *Cylindrospermopsis raciborskii* was discovered in Indiana in 2001. Late in the summer of 2007, a health advisory was issued by the ISDH limiting recreational use on Geist Reservoir based on high concentrations of another potentially toxic blue green algae, *Microcystin-LR*. It is important to note that although these species have been identified in some Indiana lakes and reservoirs, they are not present 100% of the time and it is extremely rare for them to cause toxicity. While toxicity among blue-greens is generally well known and characterized, their dynamics are not well understood.

Presently, there are no federal drinking water standards for blue-green algae. "Blue-green algae (cyanobacteria), other freshwater algae, and their toxins" appeared on USEPA's second federal Drinking Water Contaminant Candidate List (CCL), published in 2005. USEPA uses the CCL to prioritize research and data collection efforts to help determine whether a specific contaminant ought to be regulated. In 2007, USEPA determined that there was insufficient information regarding the adverse health effects of blue-green algae and their toxins, their known/likely occurrence, and whether there exist meaningful opportunities for health risk reduction to warrant development of a water quality standard for blue-green algae at this time (USEPA, 2007). Details regarding USEPA's decision and a fact sheet describing the CCL-2 are available online at:

http://www.epa.gov/safewater/ccl/reg_determine2.html#supportdocs

IDEM does not use information regarding the presence of blue-green algae to make 305(b) assessments due to the lack of a federal drinking water standard for them and because their dynamics in Indiana lakes and reservoirs is not yet well understood. However, recognizing that these species may pose a potential water quality problem, their presence when confirmed for a given lake or reservoir is noted in IDEM's ADB to facilitate tracking of these waters. More information on *Cylindrospermopsis* and other potential toxin-producing blue-green algae in Indiana waters is available from Indiana Department of Natural Resources (IDNR) at:

http://www.in.gov/dnr/fishwild/fish/cylind.htm

Indiana Clean Lakes Program

CWA Section 314 Assessments of Lake Trends and Trophic Status

IDEM bases its Section 314 assessments of trend and trophic state of Indiana's lakes on data collected by staff and students at Indiana University's School of Public and Environmental Affairs (SPEA) through the Clean Lakes Program (CLP). Indiana's CLP is funded through a CWA Section 319 grant. Lake assessments are included in this report (Appendix G).

CLP monitoring and IDEM's Section 314 assessments follow a five-year basin rotation strategy. This strategy differs somewhat from that which is used for river and stream sampling because lakes are not as equally distributed across the Indiana landscape as rivers. While some basins contain very few lakes, others contain more than can feasibly be sampled in a given year. In addition, new lakes created in reclaimed coal mine areas have added another year, at least, to the previous sampling cycle rotation. As a result, it now takes nearly six years instead of five to complete a sampling rotation of the lakes and reservoirs in all the major basins of the state.

The Indiana Trophic State Index (TSI) is used to assign points for each of ten common water quality parameters. The total of these points for a particular lake is that lake's trophic or TSI score. Scores range from 0 to 75 points, with lower numbers indicating waters with the least amount of nutrient enrichment. Details on the water quality parameters used to calculate Indiana's TSI can be found in IDEM's CALM, located in Appendix A of this report.

For the purposes of CWA Section 314 assessments, Indiana lakes were placed in one of five classes per USEPA guidelines (USEPA 1997b) based on their trophic state as measured by the Indiana TSI score. The lake classes used in this report, in order of increasing eutrophication, are shown in Table 21. A summary of the trophic status information for lakes assessed between 2000 and 2004 is presented in Table 22.

Table 21: Lake Classification Scheme for Indiana.

Trophic State		TSI Score
Increasing Eutrophication ↓	Oligotrophic	less than 15 points on the Indiana TSI scale
	Mesotrophic	16-31 TSI points
	Eutrophic	32-46 TSI points
	Hypereutrophic	greater than 47 TSI points
	Dystrophic	lakes with little plant growth despite the presence of nutrients; usually due to high humic conditions

Table 22: Trophic Status of Lakes Assessed 2000-2004.

Trophic Status	Number of Lakes	Acres
Oligotrophic	76	12,235
Mesotrophic	185	73,387
Eutrophic	100	14,040
Hypereutrophic	37	3,348
Total Number Assessed	398	103,010

Source: Indiana 305(b) Assessment Database

Indiana now has enough data collected to begin conducting some cursory trend analyses on the trophic status of lakes in the state (Table 23). Of the lakes sampled from 2000-2004, approximately 11% (5% of the acres assessed) show some water quality improvement due to decreasing nutrient levels and effects. Thirty-seven percent of the lakes (23% of the acres assessed) appear to be stable, neither losing nor gaining in levels and effects of nutrients. Eight percent of the lakes sampled during this time (12% of the acres assessed) show degraded water quality due to increasing nutrients. The water quality trend is fluctuating for 34% of the lakes (58% of the acres assessed) and unknown for approximately 10% of the lakes (2% of the acres assessed). A lack of detectable trend in the first of these two categories may be due to abnormal seasonal effects or changing activities in the surrounding watershed. An unknown trend, as used in this report, reflects having insufficient data points to determine a trend, as in the case of newly-created or never-before-sampled lake.

Table 23: Trends in the Trophic Status of Lakes Assessed 2000-2004.

Trend	Number of Lakes	Acres
Improving	44	5,480
Stable	150	23,705
Fluctuating	136	60,214
Degrading	34	11,897
Trend Unknown	39	1,907
Total Number Assessed	403	103,203

Source: Indiana 305(b) Assessment Database

These assessments have not been revised for this cycle due to a vacancy in IDEM's Lakes Coordinator position. However, IDEM has received results from the CLP for its 2005 sampling season and anticipates receiving results for the 2006 sampling season in time to complete the next round of CWA Section 314 lakes assessments by April 1, 2009, at which time the electronic update of Indiana's CWA assessment information will be submitted to USEPA.

WETLANDS ASSESSMENT

The IDEM administers the CWA Section 401 Water Quality Certification (WQC) Program. IDEM regulates the placement of fill materials, excavation (in certain cases), and mechanical clearing of wetlands and other waterbodies. IDEM draws its authority from the federal CWA, state law and rules for state regulated wetlands, and from Indiana's WQS. IDEM regulates some activities in wetlands in conjunction with the ACOE.

Any person who wishes to place fill materials, excavate or dredge, or mechanically clear (use heavy equipment) within a jurisdictional wetland, lake, river, or stream must first apply to the ACOE for a CWA Section 404 permit. If the ACOE decides a permit is needed, then the person must also obtain a CWA Section 401 water quality certification from IDEM. Placement of fill into nonjurisdictional wetlands is regulated by Indiana's Wetlands Activity Permits rule and state law.

Under CWA Section 401, IDEM reviews the proposed activity to determine if it will comply with Indiana's WQS. The applicant may be required to avoid impacts, minimize impacts, or mitigate for impacts to wetlands and other waters. IDEM will deny water quality certification if the activity will cause adverse impacts to water quality. No project may proceed until it has received a certification from IDEM. A key goal of the program is to ensure that all activities regulated by IDEM meet the no net loss of wetlands policy. Table 24 provides information regarding historical and present estimates of wetland resources in Indiana.

Table 24: General Wetland information.

Statistic	Amount
Total surface area of the state of Indiana	23,310,000 acres
Estimate of wetland acreage in Indiana circa 1700	5,600,000 acres
Wetland acreage in Indiana circa 1986 (National Wetland Inventory)	813,000 acres
Percent of surface area of Indiana covered by wetlands circa 1700	24.1%
Percent of surface area of Indiana covered by wetlands circa 1986	3.5%
Percent of total area of wetlands that are wholly or partially contained within managed lands (state, local, federal and private areas)	14%
Percent of Indiana's total wetlands that are 0.25 acres or less in size	11.6%
Percent of Indiana's total wetlands that are 0.50 acres or less in size	29.5%
Percent of Indiana's total wetlands that are 1.00 acres or less in size	46.9%
Percent of Indiana's total wetlands that are 5.00 acres or less in size	80.2%

Development of Wetland Water Quality Standards

Draft wetland water quality standards were preliminarily adopted by the WPCB February 13, 2002. However, with the passage of isolated wetland legislation, IDEM is not pursuing final adoption of these standards.

Integrity and Extent of Wetland Resources

Wetlands occur in and provide benefits to every county in Indiana. The lack of quantitative information on some aspects of Indiana's wetland resources is a major obstacle to improving wetland conservation efforts. The most extensive database of wetland resources in Indiana is the National Wetlands Inventory developed by the USFWS. Indiana's National Wetlands Inventory maps were produced primarily from interpretation of high-altitude color infrared aerial photographs (scale of 1:58,000) taken of Indiana during spring and fall 1980-87. The maps indicate wetlands type, using the Cowardin *et al*. classification scheme. Very narrow wetlands in river corridors and wetlands under cultivation at the time of mapping are generally not depicted. Forested wetlands are poorly described. IDEM has recently entered into a partnership with Ducks Unlimited to update the palustrine wetlands mapped in Indiana. This effort is scheduled for completion in 2009 and will become an update to the National Wetland Inventory.

The IDNR conducted the most recent and complete analysis of this database in 1991. According to the report, Indiana had approximately 813,000 acres of wetland habitat in the mid-1980s when the data were collected (Table 25). Wetland loss or gain since then is not known at this time (Rolley 1991).

Table 25: Type and Extent of Indiana's Wetlands.

Wetland Type (Cowardin Classification)	Historical Extent (acres)	Extent as of mid-1980s (acres)
Palustrine scrub/shrub (PSS)		42,000
Palustrine forested (PFO)		504,000
Palustrine emergent (PEMB)		55,000
Palustrine emergent seasonally flooded (PEMC)		68,000
Palustrine emergent semi-permanently flooded (PEMF)		21,000
Palustrine open water (POW)		99,000
Lacustrine limnetic open water (L10W)		141,000
Riverine (R)		53,000
Total wetland resources	5,600,000	813,000

Source: Rolley, 1991

Wetland Protection Activities

In addition to the review of applications for Section 401 Water Quality Certification and state regulated wetland permits, the program works on additional projects devoted to wetland assessment and wetland protection:

- IDEM staff work closely with the ACOE, USFWS, and IDNR to evaluate projects in planning and to coordinate requirements for various state and federal permits related to wetlands;
- IDEM maintains a web page devoted to wetlands and water quality issues. This page includes information on the status of Indiana's wetlands, current laws and rules, conservation programs, and links to other regulatory and non-regulatory wetland programs. The Water Quality Certification staff conduct outreach events at various locations to promote the importance of wetlands and to educate the public on regulations protecting wetlands;
- IDEM continues to work closely with all partners in the Indiana Wetland Conservation Plan; and

The wetlands section merged with the Rule 5 and Rule 13 storm water sections this year. More information about these programs can be found at:

http://www.in.gov/idem/permits/water/wastewater/wetwthr/storm/rule5.html
http://www.in.gov/idem/permits/water/wastewater/wetwthr/storm/rule13.html

PUBLIC HEALTH/AQUATIC LIFE CONCERNS

The release of toxic materials into the aquatic environment can produce effects in several ways:

- Contaminants present in acutely toxic amounts may kill fish or other aquatic organisms directly;
- Substances present in lesser, chronically toxic amounts can reduce densities and growth rates of aquatic organisms and/or become concentrated in their body tissues. These substances can be further passed on to humans through consumption of the organism; and
- Toxic materials in the water could potentially affect human health by contaminating public water supplies. However, at this time IDEM has no data to indicate that there have been any adverse human health effects due to toxic substances in surface water supplies.

In the last several years, advances in analytical capabilities and techniques and the generation of more and better toxicity information on chemicals have led to an increased concern about their presence in the aquatic environment and the associated effects on human health and other organisms. Because many pollutants are likely to be found in fish tissue and bottom sediments at levels higher than in the water, much of the data on toxic substances used for fishable use assessments in this report were obtained through the fish tissue and surficial aquatic sediment contaminants monitoring program.

While not all species of fish found in Indiana lakes and streams nor all waters have been tested, carp are commonly found to be contaminated with both polychlorinated biphenyls and mercury at levels exceeding the state's benchmark criteria for these contaminants in fish tissue.

Fishable use assessments are reported separately from aquatic life use in order to provide more information about each individual designated use. Concerns related to fish consumption can be evaluated independently by referring to the ISDH and FCA online at:

http://www.in.gov/isdh/fca/

It is expected that as more lakes and streams are monitored, toxicants will be found at levels of concern in the new samples (i.e., mercury and/or PCBs).

A diverse and healthy fish community is considered an indication of good water quality. Serious public concern is generated when dead and dying fish are noted in the aquatic environment since this is sometimes evidence of a severe water quality problem and may indicate the long term loss of use of affected water as a fishery. A fish kill can result from:

- The accidental or intentional spill of a toxic compound or oxygen-depleting substance into the aquatic environment;
- Continuous industrial or municipal discharge which may release, due to a system upset, an atypical effluent containing high concentrations of pollutants; and
- Natural causes such as disease, extreme draught, or depletion of dissolved oxygen from extreme weather conditions.

IDEM's Office of Land Quality tracks spills and fish kills that are reported to IDEM or discovered by agency staff. The total number of each recorded from 1998 to 2007 are listed in Table 26.

Table 26: Calls, Spills and Fish Kills Reported in 1998 to 2007.

Year	Calls	Spills	Fish Kills
1998	2649	1393	28
1999	2507	1246	41
2000	2930	1491	43
2001	3093	1591	51
2002	3043	1666	55
2003	3026	1551	30
2004	2829	1406	37

GROUND WATER ASSESSMENT

INTRODUCTION TO INDIANA GROUND WATER

Ground water is an important resource for Indiana citizens, agriculture, and industry. The majority of the state's population use ground water for drinking water and other household uses. IDEM's 2006 Annual Compliance Report for Indiana Public Water Supply (PWS) Systems is online at:

http://www.in.gov/idem/compliance/water/drinkingwater/compeval/2006acr.pdf

During the growing season, ground water is withdrawn at an average rate of 282.9 million gallons per day (mgd) for crop and turf irrigation (based on a 90-day season). Industry withdraws an average 98.6 mgd of ground water, and 31.3 mgd is used for energy production (Ralph Spaeth, Indiana Department of Natural Resources, *written communication*, 2000). Since December 2000, no statewide ground water monitoring studies have been conducted due to budgetary and staffing constraints. However, a statewide ground water monitoring network is scheduled to begin spring of 2008.

Major Sources of Ground Water Contamination

The major contaminant sources impacting Indiana ground water as of 1998 are listed by general activity types in Table 27. All sources listed are a potential threat to ground water. However, the

degree to which the source is a threat to ground water depends on several factors, the most significant being hydrogeologic sensitivity. Other major risk factors include location of the contaminant source relative to drinking water sources, toxicity of the contaminant, and the size of the population at risk. All risk factors listed in Table 27 were considered in selection of the ten priority contaminant sources, and those risk factors relevant to the highest priorities are identified. Classes of contaminants commonly associated with each highest priority contaminant source are also given. Due to resource constraints, the information in Table 27 has not been significantly updated since the 2000 305(b) report. However, anecdotal evidence indicates the same major contaminant sources are impacting Indiana ground water now in 2008 as they were in 1997 and 1998.

Table 27: Major Sources of Ground Water Contamination.

Contaminant Source	Highest Priority	Risk Factors[1]	Type of Contaminant[2]
Agricultural Activities			
Agricultural chemical facilities		A,C,H,I	5
Commercial fertilizer applications	X	A, C, D, E	5
Confined animal feeding operations	X	A, D, E	5, 9
Farmstead agricultural mixing and loading procedures			
Irrigation practices		A,C,H,I	1,2,5,8,9
Manure applications	X	A,C,H,I	5, 9
Pesticide applications		A,C,H,I	1,2
Storage and Treatment Activities			
Land application		A,C,H,I	5,9
Domestic and industrial residual applications		A,C,H,I	5,9
Material stockpiles		A,C,H,I	5,9
Storage tanks (above ground)		A,C,H,I	
Storage tanks (underground)	X	A, B, C, D, E, F	2, 3, 4
Surface impoundments	X	A, C, D, E, F	1, 2, 3, 4, 5, 6, 7, 9
Waste piles		A,C,H,I	5,9
Disposal Activities			
Deep injection wells			
Landfills (constructed prior to 1989)	X	A, B, C, D, E, F	1, 2, 3, 4, 5, 6, 7, 8, 9
Permitted landfills (constructed 1989- present)			
Septic systems	X	A, C, D, E, F, G	1, 2, 3, 4, 5, 7, 9

Shallow (Class V) injection wells	X	A, B, C, D, E, I	1, 2, 3, 4, 5, 7, 9
Other			
Hazardous waste generators		A	
Hazardous waste sites		A	
Industrial facilities	X	A, B, C, D, E, F	1, 2, 3, 4, 5, 7, 8, 9
Liquid transport pipelines (including sewer)		A	8
Materials spills (including during transport)	X	A, B, C, D, E, F	1, 2, 3, 4, 5, 7, 8, 9
Material transfer operations		A	
Small-scale manufacturing and repair shops		A, I	8
Mining and mine drainage		A	7,8
Salt storage (state and nonstate facilities) and road salting	X	A, C, D, E, F	6
Urban runoff		A, C, H, I	1, 2, 4, 5, 7, 8, 9

Source: USEPA 2006a; 2007

[1]Factors considered in selecting the contaminant source: (A) human health and/or environmental risk (toxicity); (B) size of the population at risk; (C) location of source relative to drinking water source; (D) number and/or size of contaminant sources; (E) hydrogeologic sensitivity; (F) documented state findings, other findings; (G) high to very high priority in localized areas, but not over majority of Indiana; (H) geographic distribution/occurrence; (I) lack of information

[2] Classes of contaminants associated with contamination source: (1) Inorganic pesticides; (2) Organic pesticides; (3) Halogenated solvents; (4) Petroleum compounds; (5) Nitrate; (6) Salinity/ brine; (7) Metals; (8) Radionuclides; (9) Bacteria, Protozoa and Viruses

Nitrate is a potential contaminant from the following high priority sources listed in Table 27: commercial fertilizer applications, concentrated animal feeding operations (CAFOs), and septic systems. Nitrate, a highly mobile and soluble contaminant, is the most frequently detected ground water contaminant in rural areas. However, determining the source of nitrates detected in ground water can be difficult and costly.

For the 1999 and 2000 crop production season, 537 million tons and 970 million tons, respectively, of commercial fertilizer containing nitrogen were sold in Indiana for application on some 12 million acres of cropland, most of which was applied to nearly 6 million acres of corn (Indiana Agricultural Statistics Service 1999-2000). Unlike pesticides, the purchase and application of commercial fertilizer is not regulated by the Office of the Indiana State Chemist. When applied at the proper rate and time, commercial fertilizer poses little threat of contamination to ground water. Purdue University Cooperative Extension Service staff, United States U.S. Department of Agriculture Natural Resources Conservation Service (USDA-NRCS) staff and private consultants assist crop producers in developing nutrient management plans that focus on meeting crop nutrient needs based on realistic goals.

Confined feeding operations and larger concentrated animal feeding operations exist throughout Indiana as an integral component of Indiana's agricultural economy. In 2001, the Indiana WPCB adopted new confined feeding operation (CFO) regulations (327 IAC 16), as required by IC 13-18-10, that provides design, construction and operational performance standards for all state-

regulated CFOs. This is not to be confused with the NPDES permit program that regulates CAFOs. The WPCB adopted new NPDES regulations for CAFOs in January of 2004. These regulations mirror the federal regulations for animal feeding operations and include the recent amendments to the federal regulations. The NPDES regulations for the issuance of individual NPDES permits for CAFOs are found at 327 IAC 5-4-3 and the regulations for the issuance of NPDES general permits for CAFOs are found at 327 AIC 15-15-5. Additionally, the USDA-NRCS also works closely with livestock producers who request financial and technical assistance for building livestock waste storage facilities and to install or implement conservation practices that serve to reduce soil erosion and nutrient loss. The primary concerns associated with CAFOs are the proper storage and land application of the large volumes of ammonia-containing manure produced by these operations. The ammonia form of nitrogen is converted to nitrate through biological processes in the soil. Consequently, the rate of manure application to farmland is a major concern when the application provides more nitrogen than a crop will use allowing excess nitrogen to move into underlying aquifers. The new regulations also address the need to consider the phosphorous content of manure in determining the agronomic rates for land application.

Properly constructed and maintained septic systems provide satisfactory on-site treatment of domestic wastewater in rural and unsewered suburban areas of Indiana. However, improperly constructed or poorly maintained septic systems, as well as systems operating in areas of high seasonal water tables or other ground water sensitive areas, are also of concern as a source of nitrate contamination to ground water.

Landfills and underground storage tanks are a high priority ground water contamination concern largely due to practices or activities that occurred prior to construction standards and legislation established for the protection of ground water. Landfills constructed after 1988 have been required to adhere to stringent construction standards. Since 1988, underground storage tank registration, upgrading, closure activity and site assessment have been closely reviewed by the IDEM Underground Storage Tank (UST) Section. In accordance with federal and state mandates underground storage tanks installed prior to December 22, 1988, were to be either properly protected against spills, overflows and corrosion, or properly closed.

Class V underground injection wells (UIWs) are widespread throughout the state and occur in high concentration in several areas including some in which ground water is highly sensitive to contamination. Class V wells release a wide variety of contaminants into or above aquifers supplying drinking water. The large number and diversity of Class V wells combined with lack of information regarding effects of these wells on ground water pose a significant potential threat to ground water. Indiana Class V wells are regulated by the USEPA. The USEPA targeted those Class V wells that pose the greatest environmental risk and in 2000 implemented more intensive regulations and enforcement for large capacity cesspools and motor vehicle waste disposal wells.

Several cases of ground water contamination due to industrial facilities or their ancillary operations have been documented in Indiana. Although many contamination events occurred prior to the development of regulations for the storage and handling of industrial materials, ground water contamination still occurs as a result of either accidents or intentional dumping of waste. In 1998, Indiana's Secondary Containment of Aboveground Storage Tanks Containing Hazardous Materials Rule (327 IAC 2-10) was adopted. This rule requires that new facilities provide secondary containment for storage of 660 gallons or more of hazardous wastes if the facility is located outside an approved delineated wellhead protection area. The rule is more

protective if the facility is located within an approved delineated wellhead protection and requires secondary containment if 275 gallons or more of hazardous materials are stored there. The secondary containment rule, along with outreach and education programs has alleviated a number of problems. However, these activities continue to be a potential source of contamination to ground water in Indiana.

The storage and extensive use of salt as a deicing agent during the winter months has an impact on ground water. Ground water contamination from road salt has been documented in Indiana. Efforts are being made by the Indiana Department of Transportation (INDOT) to build salt storage facilities in areas where ground water is not sensitive to contamination and to upgrade existing facilities to protect ground water. Currently all INDOT salt storage facilities are covered by domes or canopies, and several new facilities were built to contain all surface runoff on-site to reduce ground water contamination. In addition, road salt usage and application rates have been significantly reduced from past years through computerized weather forecasting and roadway temperature sensors.

Ground water contamination as a result of spills can be avoided or minimized if spills are properly handled and cleaned up. Unreported spills may contribute to ground water contamination. Spill handling and clean up, when not properly executed, create a concern for ground water contamination. Indiana's Spills; Reporting, Containment and Response Rule (327 IAC 2-6.1) ensures that spills are reported, properly handled and cleaned up.

Ground Water Protection Programs

Programs to monitor, evaluate, and protect ground water resources in Indiana occur at all levels of government. At the state level, several ground water protection programs and activities have been implemented or are in the process of being implemented. Table 28 lists the state's ground water protection programs and activities, developmental stage of the program or activity, and IDEM or agencies responsible for the program's implementation and/or enforcement.

Table 28: Summary of State Ground Water Protection Programs through 2007.

Program or Activity	Status	State Agency/Organization
Active SARA Title III Program	Fully established	IDEM-OLQ[1]
Ambient ground water monitoring program	Under development	IDEM-OWQ
Aquifer sensitivity assessment	Fully established	IDEM-OWQ, IDNR, IGS[2], OISC[3]
Aquifer mapping/basin studies	Under development	IDNR, IDEM-OWQ
Aquifer/ hydrogeologic setting characterization	Fully established	IGS, IDEM-OWQ, IDNR
Bulk storage program for agricultural chemicals	Fully established	OISC
Comprehensive data management system	Under development	IDEM-OWQ
Complaint response program for private wells	Fully established	IDEM-OWQ
Confined animal feeding program	Fully established	IDEM-OWQ
Ground water discharge permits for constructed wetlands	Under development	IDEM-OWQ
Ground water Best Management Practices	Under development	OISC*, IDEM-OWQ
Ground water legislation	Fully established	IDEM, IDNR, OISC, ISDH
Ground water classification	Fully established	IDEM-OWQ
Ground water quality standards	Fully established	IDEM-OWQ
Land application of domestic and industrial residuals	Fully established	IDEM-OLQ
Nonpoint source controls	Under development	IDEM-OWQ
Oil and Gas	Fully established	IDNR
Pesticide State Management Plan	Pending	OISC*, IDEM-OWQ, IDNR, IGS
Pollution Prevention Program	Fully established	IDEM-OPPTA[4]
Reclamation	Fully established	IDNR
Resource Conservation and Recovery Act (RCRA) Primacy	Fully established	IDEM-OLQ
Sensitivity assessment for drinking water/ wellhead protection	Fully established	IGS, IDEM-OWQ
Spill Monitoring	Fully established	IDEM-OWQ
State Superfund	Fully established	IDEM-OLQ
State RCRA Program incorporating more stringent requirements than RCRA primacy	Fully established	IDEM-OLQ
State septic system regulations	Fully established	ISDH

Program or Activity	Status	State Agency/Organization
Underground storage tank installation requirements	Fully established	IDEM-OLQ
Underground Storage Tank Remediation Fund	Fully established	IDEM-OLQ
Underground Storage Tank Permit Program	Fully established	IDEM-OLQ
Underground Injection Control Program	Fully established for Class II wells	IDNR
Well abandonment regulations	Fully established	IDNR
Wellhead Protection Program	Fully established	IDEM-OWQ
Well installation regulations	Fully established	IDNR

*indicates lead agency involved in enforcement or implementation
"Pending" is used to describe those programs that have a written draft policy "under development" is used to describe those programs still in the planning stage.
[1]OLQ Office of Land Quality; [2]IGS Indiana Geological Survey; [3]OISC Office of the Indiana State Chemist; [4]OPPTA Office of Pollution Prevention and Technical Assistance (IDEM);

Indiana's Ground Water Quality Standards became effective in March 2002. The language of the rule, which includes numeric standards, provides ground water protection to wells and allows for the classification of ground water. The rule states that all ground water of the state shall be classified as drinking water class ground water unless it is classified as: limited class ground water or impaired drinking water class ground water. Basically, IDEM may classify ground water as limited when ground water is shown to have a yield of less than 200 gallons per day or a total dissolved solids concentration of more than 10,000 ppm. Additionally, ground water that is in the crop root zone, in a coal mined area, or in an injection zone of a permitted Class I, II or III injection well or gas storage well may be considered limited. IDEM may classify ground water as impaired when specific conditions are met. These conditions include but are not limited to:

- The ground water is not in a state approved wellhead protection area established pursuant to 327 IAC 8-4.1;
- The ground water has one or more contaminant concentrations above the numeric criteria established in the rule;
- The commissioner has approved a ground water remediation, closure, cleanup, or corrective action plan that describes the nature and extent of contaminants exceeding the criteria.

In addition, IDEM's commissioner may deny a request to classify ground water as impaired drinking water class if the exceedance of the contaminant was caused by an illegal action of the person seeking the change in classification.

In 2000, USEPA approved Indiana's Source Water Assessment Plan developed by Indiana stakeholders. IDEM made the decision to prepare Source Water Protection Plans (SWAPs) for public water systems with the exception of community water systems that utilize ground water as their primary source of water. Community water systems are required by the Indiana Wellhead Protection Rule (327 IAC 8.4.1) to prepare a wellhead protection plan for each well or wellfield that provides water to the public. IDEM contracted the majority of field work and the preparation of the SWAPs. Since 2000, the contractors have identified the source water areas for

approximately 3,600 public water systems and the watersheds for surface water systems. In the delineated source water areas, IDEM contractors have inventoried the potential sources of contamination from regulated facilities and assessed water system susceptibility to contamination. As of the end of 2007, all SWAPs for the 3,600 public water systems surveyed by IDEM's contractors and final reports were distributed by IDEM to the owners of the public water system. As a result of this effort, IDEM's source water protection program is completely implemented and satisfies the requirements of substantial implementation of the Source Water Protection Program as defined by IDEM and accepted by USEPA Region 5.

In March of 1997 the Indiana Wellhead Protection Rule (327 IAC 8-4.1) became effective. The Wellhead Protection Program is a proactive program that protects public water supplies from contamination. The Wellhead Protection Rule outlines the minimum requirements community public water supplies must meet to comply with the Wellhead Protection Program. The Wellhead Protection Program is a part of the Source Water Protection Program. As of the end of 2005, 649 wellhead protection plans had been submitted to IDEM for review and 614 plans have been approved for those communities. An approved plan signifies that a community has met the requirements of the Indiana Wellhead Protection Rule and has developed strategies to adequately protect their community water supplies from becoming contaminated.

In addition to regulatory programs and other structured ground water protection activities listed in Table 28, there are several educational programs conducted in Indiana that place an emphasis on ground water protection. The Purdue University Extension program "Safe Water for the Future" is an umbrella for several programs that provide resources on drinking water protection for individuals and communities. The Farm*A*Syst and Home*A*Syst programs are essentially wellhead protection programs for rural and domestic private wells. A series of publications and brochures on wellhead protection are also available to assist communities working on wellhead protection. "Watershed Connections" brings together local contacts to produce a community-specific publication on water resources and their protection. Indiana Project WET (Water Education for Teachers) and Indiana's Water Riches are two general water education programs that provide information about ground water protection. The Purdue Extension Water Quality Program has available through their website more than 70 Purdue Extension publications addresses specific topics for the general public. For example, the Purdue Pesticide Programs publication "Nitrate and Indiana's Ground Water" describes the occurrences of nitrate across the state, potential causes of contamination, health risks associated with nitrates and types of available treatment technology if nitrates are found in ground water.

Ground Water for Drinking Water Monitoring Data

In 1998, a project was conducted to assess the ambient ground water conditions in the state. The project was the ground water monitoring network component of the Pesticide State Management Plan. The ground water monitoring network was established to provide a statistical evaluation of possible trends in pesticide occurrences and concentrations in major hydrogeologic settings of the state. Of the 230 hydrogeologic settings identified by the Indiana Geological Survey, approximately 60 were grouped into 22 "type" hydrogeologic settings that represent the state (Figure 6). Quarterly sampling of nearly 400 wells selected from the 22 hydrogeologic settings was initiated in 1998. Wells were sampled every 3-4 months for seven consecutive periods ending in December 2000. As presented in the 2002 Integrated Water Quality Monitoring and Assessment Report, sampling results indicate no clear or statistically significant detections of

pesticides or VOC's in sampled wells. During the effort (in 1998), wells in each of the 22 hydrogeologic settings were also sampled for nitrates. Nitrate levels of three ppm or lower are assumed to be naturally occurring. The hydrogeologic settings indicating nitrate levels above 3 ppm were the Topeka Fan, Brighton Fan, East Fork White River, Wabash River Valley, and the Mitchell Plain Karst region. Since December 2000, no subsequent statewide ground water monitoring efforts have been conducted due to budgetary and staffing constraints.

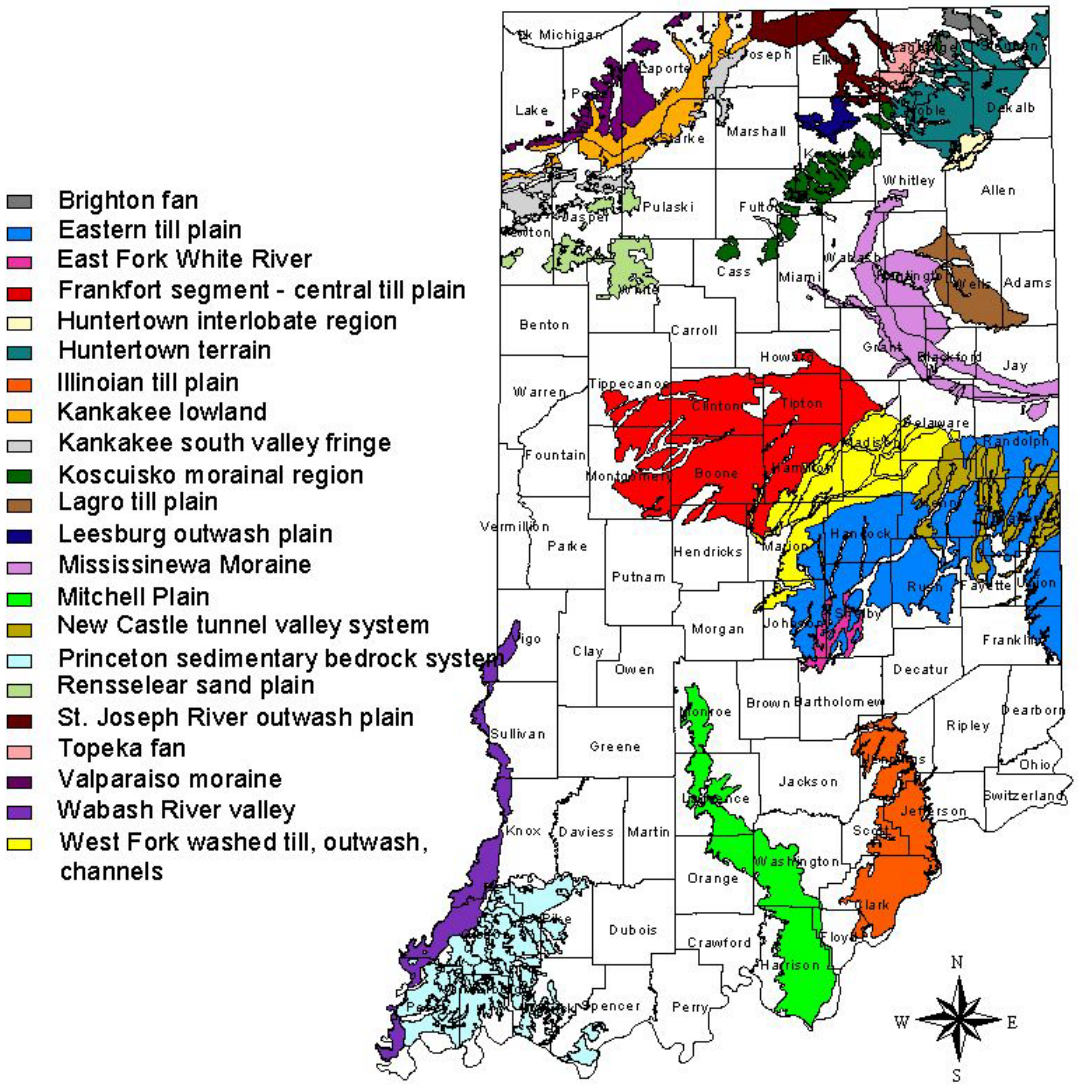

Figure 6: Representative Hydrogeologic Setting Monitoring Networks

The IDEM Drinking Water Branch PWS Compliance Section receives ground water compliance monitoring results reported by PWS for volatile organic compounds (VOCs), synthetic organic compounds (SOCs), inorganic compounds (IOCs), nitrates (NO_3), and radionuclides. Public water systems include community, nontransient noncommunity and transient noncommunity systems. A community system is defined as a system that serves water to the public and has at least 15 service connections used by year-round residents or regularly serves at least 25 year-round residents. Examples of community water systems are municipal systems, mobile home

parks, nursing homes and homeowners associations. A nontransient noncommunity water system is defined as a public water system that is not a community water system which regularly serves the same 25 or more persons at least six months per year. Examples of nontransient noncommunity water systems could include restaurants, factories, daycares and schools. A transient noncommunity is defined as a noncommunity water system that does not serve at least the same 25 people over six months per year. Examples of transient noncommunity water systems include restaurants, rest-stops, and gas stations.

Community and Noncommunity nontransient systems are required to test for thirty regulated SOCs, and 21 VOCs. Community systems monitor for 12 regulated IOCs and sodium (a special monitoring requirement). Nontransient noncommunity systems monitor for eleven regulated IOCs (excluding sodium and fluoride). All PWS systems including transient noncommunity are required to test for nitrates. Only community systems are required to monitor for radionuclides. Radionuclide monitoring consists of analysis for gross alpha particle activity. Samples collected by PWS are from entry points, which occur after treatment and before the distribution system. Entry point data can be from a single well or blended from two or more wells. For PWS data, the reporting period was dependent on sampling frequency requirements for the parameter group. For VOC, SOC, and IOC data, community and nontransient noncommunity systems are required to sample a minimum of once every three years or more frequently if certain levels of contaminants are detected.

All PWS systems are required to test for nitrate. Nitrate concentrations were utilized in Figures 7 through 9 to illustrate general ground water quality trends across the state. The ground water quality data information used in this analysis were compliance monitoring values reported to the IDEM Drinking Water Branch PWS Compliance Section by PWS systems. The presentation of this data is a representation of quality of water after treatment by PWS and not the quality of the ambient conditions of ground water prior to being pumped from the ground itself. The finished water quality information was used due to the availability and quantity of data. Although these data do not represent ambient conditions, finished water quality data provides information that can be analyzed in order to help in prioritizing future ambient ground water monitoring efforts. Reported nitrate data from 2000 through 2007 were utilized to determine the relative occurrences of nitrate as well as the spatial distribution of nitrate concentrations. It is generally accepted that nitrate concentrations of three ppm or less can be considered to be naturally occurring in ground water. Figure 7 illustrates the distribution of sampling points across the state.

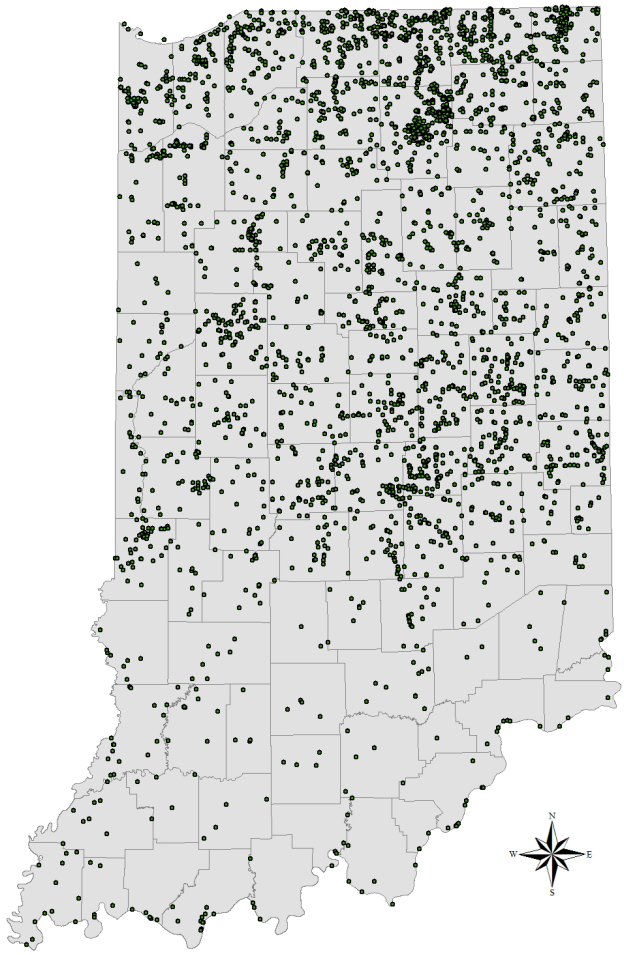

Figure 7: General Nitrate Sample Point Distribution.

All the reported nitrate data received by the IDEM Drinking Water Branch PWS Compliance Section IDEM between the years 2005 to the end of 2007 was filtered at five ppm, which is half of the maximum contaminant level (MCL) for nitrate (ten ppm). Figure 8 shows, by year, the occurrence of at least one reported value of five ppm or greater during any compliance monitoring sampling event during that year. Figure 8 does not necessarily represent values of non-compliance of drinking water standards or violations exceeding drinking water quality MCL (the drinking water standard is based on the MCL of ten ppm). Figure 8 is provided to illustrate the locations of areas that may be more vulnerable to ground water contamination.

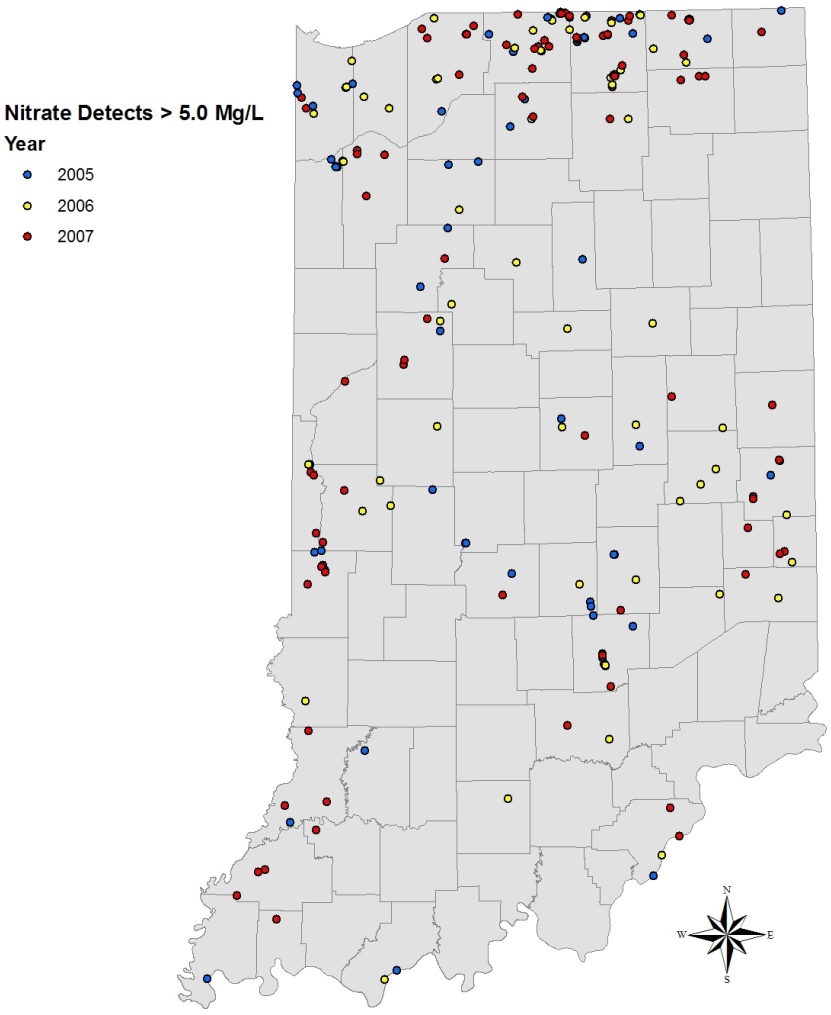

Figure 8: Nitrate Sample Results Greater than 5 ppm.

Statewide Ground Water Monitioring Network.

A Statewide Ground Water Monitoring Network (SGWMN) is scheduled to begin in the spring of 2008. Sampling locations will consist of 300 drinking water wells across Indiana. Sites selected for the SGWMN are illustrated on Figure 11. Sampling locations consist of 200 public water supply wells and 100 private (residential) wells. Sites will be sampled for volatile organic compounds (VOCs), synthetic organic compounds (SOCs), inorganic compounds (IOCs) and nitrates (NO_3). Subsequent reports shall integrate the SGWMN information as it is collected and analyzed.

APPENDIX A: INDIANA'S 303(d) LIST OF IMPAIRED WATERS

INDIANA DEPARTMENT OF ENVIRONMENTAL MANAGEMENT
OFFICE OF WATER QUALITY
2008 303(D) LIST OF IMPAIRED WATERS
SUBMITTED TO U.S. ENVIRONMENTAL PROTECTION AGENCY
PURSUANT TO CLEAN WATER ACT SECTION 303(D)

INTRODUCTION

The Indiana Department of Environmental Management's (IDEM) Office of Water Quality has updated its List of Impaired Waters. Under the Section 305(b) of the Federal Clean Water Act (CWA), each state is required to assess its waters for compliance with the state's water quality standards (WQS), which are developed to protect the beneficial uses for which waters of the state are designated (fishing, swimming, and drinking, etc.). As required by Section 303(d) of the CWA, the state is required to periodically prepare and make public a list of those waters not meeting WQS using information from the assessments conducted under CWA Section 305(b). Indiana's 2008 303(d) List of Impaired Waters must be submitted to United States Environmental Protection Agency (U.S. EPA) by April 1, 2008.

The list of impaired waters identifies the waterbody or waterbody reach that is impaired, the pollutant(s) not meeting WQS thus causing the impairment, and a schedule for development of a Total Maximum Daily Load (TMDL). A TMDL evaluation is a process that quantifies the amount of a specific pollutant that a waterbody can assimilate and still meet water quality standards. What constitutes a pollutant is described in Section 502(6) of the CWA and includes materials such as sewage, chemical wastes, biological materials, and industrial, municipal, and agricultural waste. The definition also encompasses drinking water contaminants that are regulated under Section 1412 of the Safe Drinking Water Act. The TMDL will identify how much of the pollutant is coming from point sources and nonpoint sources. It will also specify the amount of pollutant reduction necessary from each source in order to meet the water quality standard set for that pollutant. The TMDL will lay the groundwork for developing and implementing a plan to reduce the amount of the pollutant coming from each source. The public will be invited to participate in the plan to develop and implement the TMDL.

REQUEST FOR PUBLIC COMMENTS

Pursuant to IC 13-18-2-3, the 2008 draft list was published in the *Indiana Register* for a mandated 90-day public comment period. The original public comment period was to end on December 26, 2007. In response to requests for additional public meetings to discuss the list, and to provide sufficient time for the public to provide comment afterward, IDEM extended the public comment period to January 31, 2008, which provided an additional 37 days for the public to comment. The public was invited to review the list and offer comments and suggestions as to the specific waterbodies included. Any person having water quality data to support or refute the listing of a specific waterbody or to add a waterbody to the list was able to provide that information to IDEM during the public comment period. The list was also available on IDEM's website at: http://www.in.gov/idem/water/planbr/wqs/303d.html

Mailed comments were directed to:

Lawrence Wu, Rules Development Section Chief
Watershed Planning Branch
Office of Water Quality – MC 65-40
Indiana Department of Environmental Management
100 North Senate Avenue
IGCN Room N1255
Indianapolis, IN 46204-2251

PUBLIC COMMENT PERIOD DEADLINE

The public comment period for the 2008 303(d) list began on September 26, 2007, and ended on January 31, 2008. All comments postmarked, hand delivered or faxed on or before January 31, 2008, are summarized in this submission. This summary and IDEM's responses to public comments are included in Attachment E. Attachment F includes comments on Indiana's draft 303(d) provided by U.S. EPA Region 5 and IDEM's responses to them.

PUBLIC MEETINGS

IDEM presented the Draft 2008 303(d) List to the Water Pollution Control Board meeting at 1:30 p.m. on November 14, 2007, at the Harrison County Courthouse in Corydon, Indiana. This meeting was open to the public and provided the public an opportunity to discuss the list. In response to subsequent requests from the public, IDEM held two more public meetings to provide additional opportunities for discourse regarding the list. One meeting was held on January 3, 2008, at 1:30 p.m. at the offices of the Northwest Indiana Regional Planning Commission in Portage, Indiana. The other meeting was held on Monday, January 7, 2008, at 1:00 p.m. at the Indiana Government Center South Building in Indianapolis, Indiana.

DEVELOPMENT OF INDIANA'S 2008 303(D) LIST

For the development of the 2008 303(d) list, IDEM has followed, to the degree possible, the 305(b) and 303(d) reporting methods outlined in the U.S. EPA's *Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act* (U.S. EPA, 2005) and the additional guidance provided in the U.S. EPA memorandum *Information Concerning 2008 Clean Water Act Sections 303(d), 305(b), and 314 Integrated Reporting and Listing Decisions* (U.S. EPA, 2006).

U.S. EPA's guidance encourages states to develop a comprehensive listing of all monitored and assessed water bodies in the state based on the state's 305(b) assessment and 303(d) listing methodology. This format calls for the development of two lists:

- Indiana's Consolidated List contains assessment information for all waters of the state, which is developed to fulfill CWA Section 305(b) requirements.
- The 303(d) List of Impaired Waters is a subset of the Consolidated List and identifies only those waters that are impaired and for which a TMDL is required.

The state's Consolidated List (Categories 1-5) is provided in its entirety in another report: the 2008 *Indiana Integrated Water Monitoring and Assessment Report*. Indiana's finalized 303(d) List of Impaired Waters, which is comprised of Category 5 is presented here. IDEM's approach to TMDL development in the longterm along with the IDEM's schedule for TMDL development

over the next two years is provided with this report. Category 4 impairments do not require a TMDL and as such, are not are included on Indiana's 303(d) list. A discussion of those waterbody impairments placed in Category 4 of Indiana's Consolidated List is also included in this report to provide the most comprehensive picture possible regarding impairment of Indiana waters and to facilitate tracking of all known impairments.

The 303(d) list was developed using the 305(b) Assessment Database (ADB), which stores all of IDEM's water quality assessment information. Interpretation of the data and listing decisions take into account U.S. EPA guidance and IDEM's Consolidated Assessment and Listing Methodology (CALM), which is provided in Attachment B of this document. In developing the Consolidated List, each waterbody assessment unit (AU), which may consist of an entire waterbody or part of a larger waterbody, is placed into one or more of five (5) categories depending on the degree to which it supports its designated uses as determined by IDEM's assessment process. A detailed explanation of the five (5) categories is provided in Indiana's 2008 CALM. The following is a summary of the five (5) categories:

Category 1 **All designated uses are supported and and no use is threatened**[1].

Category 2 **Available data and/or information indicate that some, but not all of the designated uses are supported.**

Category 3 **There is insufficient available data and/or information to make a use support determination.**

Category 4 **Available data and/or information indicate that at least one designated use is impaired or is threatened, but a TMDL is not needed.**

A. A TMDL has been completed that is expected to result in attainment of all applicable WQS and has been approved by U.S. EPA.

B. Other pollution control requirements are reasonably expected to result in the attainment of the WQS in a reasonable period of time

C. Impairment is not caused by a pollutant.

Category 5 **Available data and/or information indicate that at least one designated use is not supported impaired or is threatened, and a TMDL is needed.**

[1]EPA recommends that states consider as threatened those waters that are currently attaining WQS, but are projected as the result of applying a valid statistical methodology to exceed WQS by the next listing cycle (every two years). IDEM recognizes the federal requirement to list waterbodies that meet U.S. EPA's definition of "threatened". However, IDEM has not determined the appropriate predictive models for the purposes of identifying future impairment. Based on this and the uncertainty associated with such models, IDEM does not assess waterbodies as "threatened" for the purposes of 303(d) listing. Waters for which there is reason to suspect a declining trend in water quality are so noted in IDEM's assessment process and in the IDEM's assessment database so that they may be prioritized for future monitoring when resources allow.

A. The waterbody AU is impaired or threatened for one or more designated uses by a pollutant(s) and require a TMDL.

B. The waterbody AU is impaired due to the presence of mercury and/or PCBs in the edible tissue of fish collected from them at levels exceeding Indiana's human health criteria for these contaminants.

The 303(d) List of Impaired waters consists of all impairments listed in Category 5. This category includes waters where the water quality standard is not attained because the waterbody AU is impaired or threatened by a pollutant(s) for which one (1) or more TMDL(s) is needed.

The 2008 303(d) list builds on the 2006 303(d) list, which was approved by U.S. EPA. Each cycle, the previous list is revised with impairments added and impairments removed to Category 5. These revisions and the reasons for them are discussed in following sections of this report so that impairments included on previous 303(d) lists or previously placed in Category 5 are accounted for in subsequent submissions. It should be noted that the U.S. EPA's 2008 guidance does not change existing rules for listing and delisting waterbodies from Category 5. The existing regulations still require states, at the request of the U. S. EPA's Regional Administrator, to demonstrate good cause for removing waterbody impairments from their 303(d) list that were included on previous 303(d) lists (pursuant to 40 C.F.R. 130.7(b)(6)(iv)). U.S. EPA's "delisting rules" are summarized here:

- **New data indicates that WQS are now being met.** Previously listed AUs that are found to be no longer impaired may be placed in Category 1 or 2 of the state's consolidated list depending on the degree to which it is meeting its designated uses.
- **The state's assessment and/or listing methodology has changed, and the AU is no longer considered impaired.** Any AU that is no longer impaired based on changes to a state's assessment and listing methodology may be placed into Category 1, 2, or 3 depending on the degree to which it supports its designated uses.
- **The state's WQS have changed and the AU is no longer considered impaired.** Any AU that is no longer impaired based on changes to a state's WQS may be placed into Category 1, 2, or 3 depending on the degree to which it supports its designated uses.
- **The original listing was found to be in error.** Any AU for which the original listing was found to be in error may be placed into Category 1, 2, or 3 depending on the degree to which it supports its designated uses.
- **A TMDL for the impairment has been approved by U.S. EPA.** Impairments for which a TMDL is approved are placed in Category 4A of the state's consolidated list.
- **The state can demonstrate that there are other pollution control requirements in place that are better suited than a TMDL to address the problem.** Impairments removed for this reason are placed in Category 4B of the State's Consolidated List.
- **The impairment is not caused by a pollutant.** Impairments resulting from stressors for which a load cannot be calculated are placed in Category 4C of the State's Consolidated List.

INFORMATION AND DATA USED TO DEVELOP INDIANA'S 303(D) LIST OF IMPAIRED WATERS

IDEM used data collected by IDEM and other organizations to develop the 2008 303(d) list. IDEM's solicitation, review and use of external data are described in detail in the State's Integrated Report. IDEM data used to develop the 303(d) list was collected in accordance with IDEM's Surface Water Quality Monitoring Strategy (SWQMS). The SWQMS describes a five-year basin rotation approach to monitoring for CWA purposes. Using this strategy, 1-2 basins (approximately 20% of the state) are monitored each year providing a comprehensive statewide data set for assessment purposes every five years. IDEM draws from the following monitoring programs for data to use in making the use support determinations required under CWA Section 305(b) assessments and subsequent CWA Section 303(d) listing decisions:

- Fixed Station Monitoring Program (water chemistry);
- Probabilistic Monitoring Program (fish community index of biotic integrity (IBI), benthic aquatic macroinvertebrate community index of biotic integrity (mIBI), water chemistry, nutrients/algal biomass, *Escherichia coli* sampling, and habitat evaluations (i.e. QHEI));
- Source Identification Program (water chemistry);
- Stressor Identification Program (fish community IBI, water chemistry, habitat);
- Fish Tissue Contaminant Program (fish tissue chemistry);
- Lakes Monitoring Program (water chemistry, nutrients, algae, secchi depth,);
- Special Studies Program for National Pollutant Discharge Elimination System (NPDES) support; total maximum daily load (TMDL) development; targeted fish tissue and sediment information, etc.).

Indiana's SWQMS and fact sheets with detailed descriptions of the monitoring programs are available on the IDEM Web site at: http://www.in.gov/idem/programs/water/quality/index.html.

U.S. EPA requires that states consider all readily available data sources in the preparation of their 303(d) lists. In addition to the aforementioned water quality data, IDEM has solicited cooperative agreements with the United States Geological Survey (USGS) to collect water quality data at the same sites sampled by IDEM, which provides data for additional parameters not sampled by IDEM. In addition to providing important data for IDEM's development of its nutrient criteria, these data are also used in 305(b) assessments and 303(d) listing decisions. IDEM routinely reviews data generated by external parties through 319 and 205(j) grant projects for potential use in 305(b) assessments. Although these data are collected by organizations external to IDEM, most are submitted to IDEM as part of the project grant agreement, making them more readily available through Nonpoint Source Program staff. IDEM's 305(b) coordinator also works closely with TMDL staff to determine whether data provided by external parties for TMDL development can be used in making water quality assessments. All data received are reviewed for usability in accordance with IDEM's Assessment Branch Quality Assurance Program Plan (QAPP).

While IDEM works with external organizations to obtain water quality data for potential use in water quality assessment processes, the ability to solicit the largest possible audience and to review the data received has been hampered in past cycles by the lack of a formal process and limited staff resources. In order to address these issues, IDEM OWQ is working to develop a framework for the solicitation, review of external data for its usability in selected OWQ programs. The goals of this project include:

- Identifying the IDEM processes for which external organizations would like to see their data used (e.g. education, planning, TMDL development, 305(b) assessment, 303(d) listing, etc.);
- Developing an effective data solicitation process;
- Developing a data quality ranking system and criteria specific for each type of proposed use; and
- Developing a process for providing technical assistance to help organizations meet the data quality criteria necessary for the process for which they want their data considered.

In 2007, it was determined that a broad data solicitation prior to having the external data framework fully developed would provide a fuller understanding of the variety of organizations that are collecting water quality data in Indiana, the types of data they are collecting and its relative data quality. The 2007 solicitation was the broadest data solicitation IDEM has conducted to date and is discussed in more detail in Indiana's 2008 Integrated Report. In response to this solicitation, IDEM received more than one hundred (100) water quality data packages and reports from (41) individual organizations.

The chemical and physical data sets received are presently being reviewed to determine their usability in IDEM's 305(b)/303(d) processes and to synthesize the information they contain relative to the development of IDEM's external data framework.

IDEM has completed its review of the biological data submitted and has determined that studies submitted by two (2) organizations, the City of Muncie and the City of Elkhart meet IDEM's quality assurance requirements and are readily available and usable in their present form for 305(b) assessment and 303(d) Listing processes. The other studies submitted contain valuable information for IDEM biologists and were considered generally usable with respect to the data quality. However they will require significant staff time to prepare them for assessment purpose and as such, are not considered readily available.

IDEM is highly encouraged by the results of its review of the biological data received and of the quality of the data received. Once IDEM's review of the chemical data is complete, all data sets determined to be usable for assessment purposes will be incorporated into assessments. Impairments identified as a result of these assessments will be added to the 2010 303(d) List of Impaired Waters.

As IDEM moves forward with its External Data Framework Project, the data submitted as a result of the 2007 solicitation will be evaluated to determine what improvements IDEM needs to make in terms of communicating its format requirements for data submissions. This information is expected to contribute to the continued development of IDEM OWQ's external data framework.

It is anticipated that OWQ's external data framework will ultimately provide the guidelines and technical assistance necessary to help organizations collecting water quality data throughout Indiana who desire the opportunity to become more involved with IDEM in working toward our shared goals of protecting and restoring Indiana's water resources.

ORGANIZATION OF INDIANA'S 303(D) LIST

IDEM has changed the organization of this report on Indiana's 2008 303(d) List. In order to facilitate review by the public and U.S. EPA, the tables that appeared in the Notice of Comment Period for the draft 2008 list have been moved to Attachment A of this report. The tables included in the body of this report reflect changes that have occurred since the draft list

was published. The tables in Attachment A reflect all changes made before and after the draft list was published. Attachment Tables A13 and A14 contain Categories 5A and 5B of Indiana's Consolidated Listing, respectively, which together comprise Indiana's 2008 303(d) List of impaired Waters.

Impairments are listed individually on Indiana's 303(d) list to achieve consistency in how U.S. EPA tracks TMDL development and to facilitate effective planning by IDEM. Therefore, a given waterbody may appear on the list in one or more places depending on the number of impairments it has. The list includes the 14-digit hydrologic unit code (HUC) and county names associated with each impairment to facilitate sorting and searching the list for specific waterbodies of interest.

WATERBODY ASSESSMENT UNITS AND INDIANA'S REACH INDEX

To facilitate the management of water quality assessment information, IDEM maintains the Assessment Database (ADB). The ADB contains records for all waterbodies in the state that are visible at a map scale of 1:100,000. For the purposes of assessment, each waterbody is assigned a unique assessment unit ID (AUID) to which all assessment information for that waterbody is associated.

Lakes are assigned a single AUID while a stream may consist of one or more AUIDs. With regard to flowing waters, AU sizes vary widely and a single segment may or may not represent the entire river or stream to which it is associated. The geographical extent and location of each assessment unit (AU) is defined for mapping purposes through a process called reach indexing. Reach indexing uses a software tool developed by U.S. EPA that works with geographical information systems (GIS) applications to "key" the AUs defined by IDEM to the National Hydrography Dataset (NHD). IDEM used these tools to create its first statewide Reach Index in 2002, which facilitates mapping of Indiana's 305(b) assessments and 303(d) listings in GIS applications and incorporation of this information into EPA's national databases.

In 2006, IDEM began a project to update its Reach Index to include a number of waterbodies that could not be indexed due to the spatial resolution of the NHD at the time the index was developed. At the time Indiana's Reach Index was created, the NHD was only available in 1:100,000 scale. Given this, a number of the state's first and second order streams and lakes that do not appear at this scale could not be indexed and are therefore not mappable using the current Reach Index. Today, the NHD is available in 1:24,000 scale for the entire state of Indiana. In order to facilitate more accurate mapping of these and future assessments, Once IDEM completes its revision of the Reach Index, all new assessment units identified must then be incorporated into IDEM's ADB for assessment purposes.

At this time, it is anticipated that IDEM's high resolution Reach Index will be completed prior to the 2010 integrated report cycle. In the meantime, IDEM has prioritized its high resolution indexing work to stay ahead of the IDEM's monitoring and assessment schedule, focusing indexing efforts in those basins next in line for assessments.

CHANGES IN SEGMENTATION AND THE EFFECT ON INDIANA'S 303(D) LIST

When Indiana created its Reach Index, most waterbodies in the state were assigned an assessment unit ID based on the 14-digit watershed in which they were located. In most cases, each 14-digit watershed was assigned a single assessment unit ID regardless of how many individual streams there are in the watershed. Therefore, an assessment of *any* stream would be

applied to *all* the streams in the watershed regardless of where the sample was located or its relative representativeness to each stream. This problem was not preventable at the time because, while the reach indexing tool had the capability to split "watershed" AUs into smaller AUs, the software had no built-in means for tracking changes in segmentation.

For the 2006 303(d) listing cycle, IDEM developed an administrative process for splitting AUs into smaller units to allow for more accurate application of assessment data. This process has been refined somewhat for the 2008 303(d) listing cycle. However, the basic process for splitting AUs is the same. Changes in segmentation are considered on a case-by-case basis and are generally made either to accommodate a more accurate assessment or to correct an earlier assessment in which the data were inappropriately applied.

Segmentation changes are based on a combination of factors including hydrology, similarities in land use and potential sources of impairment. Splitting AUs in this way allows IDEM to associate an identified impairment more accurately to the waterbody from which the sample was collected and to any others for which results are representative. When AUs are split, IDEM reevaluates any assessments made on the original assessment unit along with any recent data that is available. This reassessment process ensures that the original assessment information is properly applied to the resulting new AUs. In most cases, the original assessment applies to only one or two of the resulting AUs with the remaining units unassessed.

IDEM's methods for tracking changes in segmentation are still being refined. Per U.S. EPA's request, IDEM now retires the original AUID for any AU that has been split to facilitate tracking. Attachment A, Table A1 identifies all AUIDs that have been retired due to changes in segmentation.

It is important to note that while changes in segmentation, usually from one large AU to several smaller AUs, increase the number of impairments on the 303(d) list, they produce a more accurate representation of the number of stream miles impaired. IDEM recognizes the importance of accurate tracking in this regard, particularly when resegmentation results in changes to the total number of assessment units and stream miles listed as impaired. A table summarizing all changes in segmentation on impaired waters and the resulting changes to the 303(d) list in terms of miles impaired is provided in Attachment A, Table A1.

WATERBODY IMPAIRMENTS REMOVED FROM INDIANA'S 303(D) LIST OF IMPAIRED WATERS

Waterbody Impairments Removed from Category 5A as a Result of TMDL Development

The 303(d) list of Impaired Waters identifies waterbodies in Indiana that require a TMDL. In general, IDEM's TMDL development schedule corresponds with IDEM's rotating basin monitoring schedule unless there is a significant reason to deviate from that schedule. This strategy allows IDEM to take advantage of all available resources for TMDL development by targeting 303(d)-listed waters in a given basin for additional monitoring as sampling crews are working in that basin.

The CWA does not clearly define the timeline for TMDL development. However, U.S. EPA's most recent guidance (U.S EPA, 2005) recommends that states develop expeditious schedules of eight (8) to thirteen (13) years from the date of original listing. A schedule for TMDL development over the next two years is provided in Attachment C. This schedule is intended to help the public and EPA understand the state's priorities and assist in IDEM planning.

IDEM continues to make significant progress in TMDL development. In the draft list, a total of three hundred ninety four (394) impairments were proposed to be added to Category 4A based on the completion of a TMDL. Although these TMDLs are completed, they are at various stages in the U.S. EPA approval process. Because impairments must remain in Category 5 until TMDLs for them are approved, IDEM has added back to Category 5A all impairments associated with TMDLs that were identified in the draft list but for which approval is not expected prior to April 1, 2008 (Table A13).

Also since the draft list was published, U.S. EPA identified three (3) impairments originally proposed for delisting that were not included in the approved TMDL that was cited as the justification for delisting (Table 1). IDEM investigated this and found that these AUs were reach indexed at high resolution (1:24,000 scale) after the TMDL for impaired biotic communities in the Limberlost Watershed was approved. High resolution indexing introduces issues with tracking that are similar to those associated with AU segmentation, which are described in a previous section of this report. IDEM is presently working to develop an administrative process tracking and adding new AUs resulting from either splitting or indexing at high resolution in a watershed for which the TMDL has been approved. IDEM has decided to add these impairments to Category 5A until an administrative means of incorporating these impairments into the approved TMDL is developed. Table A.

Table 1: Waters originally proposed for delisting and placement in Category 4A based on a completed TMDL. These impairments were indexed at high resolution after the TMDL for them was approved and were added back to Category 5A until an administrative means of incorporating these impairments into the approved TMDL is developed.

BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT
UPPER WABASH	05120101050050	JAY CO	INB0155_T1013	EAST PRONG (HEADWATER)-UNNAMED TRIBUTARY	IMPAIRED BIOTIC COMMUNITIES
UPPER WABASH	05120101050060	JAY CO	INB0156_T1001	LIMBERLOST CREEK-UNNAMED TRIBUTARY	IMPAIRED BIOTIC COMMUNITIES
UPPER WABASH	05120101050060	JAY CO	INB0156_T1006	OAKLEY DITCH	IMPAIRED BIOTIC COMMUNITIES

For the 2008 cycle, IDEM has received U.S. EPA approval for the following TMDL reports:

- Total Maximum Daily Load for *Escherichia coli (E. coli)* for the Beanblossom Creek Watershed, Brown and Monroe Counties
- Total Maximum Daily Load for *Escherichia coli (E. coli)* For the Plummer Creek Watershed, Greene County
- Total Maximum Daily Load for *E. coli* Impairment St. Marys River Watershed and Maumee River, Adams and Allen Counties
- Total Maximum Daily Load for Impaired Biotic Communities and Nutrients for the Blue Creek/Habegger Ditch and Yellow Creek Watersheds, Adams County
- Total Maximum Daily Load for *Escherichia coli (E. coli)* for the Richland Creek Watershed, Greene, Monroe, and Owen Counties
- Total Maximum Daily Load for *E. coli* Impairment Big Blue River Watershed, Henry

and Rush Counties
- Wabash River Nutrient and Pathogen TMDL Development: Public Review Draft
- Total Maximum Daily Load for *Escherichia coli (E. coli)* for the East Fork Whitewater River Watershed, Wayne, Union, Fayette, and Franklin Counties
- West Fork Whitewater River
- Total Maximum Daily Load for *Escherichia coli (E. coli)* West Fork White River (WFWR) Owen County Tributary Watershed - Owen, Greene, and Monroe Counties
- Limberlost Creek Watershed Sediment and Nutrient TMDL Development: Public Review Draft
- Total Maximum Daily Load for *Escherichia coli (E. coli)* for the Sugar Creek Watershed, Hancock, Henry, Johnson, Madison, and Shelby Counties
- Total Maximum Daily Load for *Escherichia coli* (*E. coli*) for the Flatrock-Haw Creek Watershed in Henry, Fayette, Rush, Decatur, Shelby, and Bartholomew Counties

These TMDLs address a total of two hundred seventy eight (278) impairments. These impairments were added to Category 4A of the State's Consolidated List and are provided in Attachment A of this report (Tables A2 and A3). Table A2 shows impairments previously identified on Indiana's 2006 303(d) List of Impaired Waters, and Table A3 shows in impairments that were identified through the TMDL process.

Figure 1 shows the locations of all impairments for which a TMDL was completed by IDEM and approved by U.S. EPA since the April 1, 2006. The TMDL documents for all impairments listed below along with information on TMDL development and scheduled public meetings can be found online at http://www.in.gov/idem/water/planbr/wqs/tmdl/index.html.

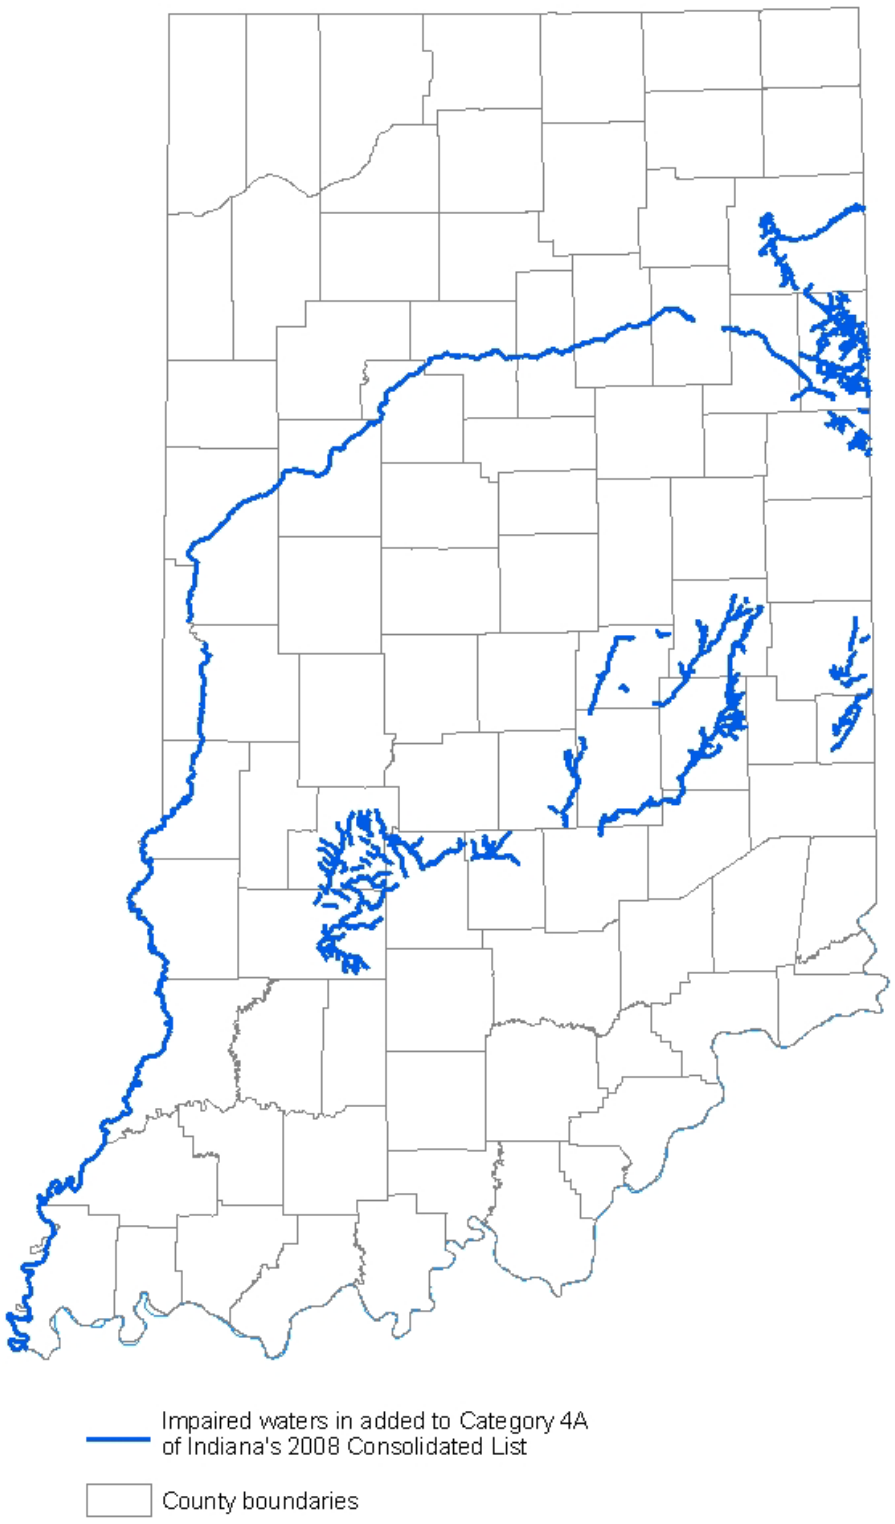

Figure 1: Map of all assessment units placed in Category 4A including impairments identified in Category 5A of the 2006 303(d) list and new impairments identified through the TMDL process.

Waterbody Impairments Removed from Category 5A as a Result of Routine Assessments

As a result of IDEM's rotating basin monitoring strategy, the waterbody impairments removed from the 2008 303(d) list are located in the Lower Wabash River Basin and Ohio River Basin. The Lower Wabash River and Kankakee River Basins were sampled by IDEM in the summer of 2004 and the Great Lakes and Ohio River Basins were sampled in 2005. Through subsequent analysis of the data from these basins, IDEM identified six (6) waterbody assessment units now meeting water quality standards for one or more previously listed impairments (Attachment A, Table A4). These waterbody assessment units were removed from Category 5A of Indiana's 303(d) list.

Waterbody Impairments Removed from Category 5A Due to Resegmentation.

Table A5 in Attachment A identifies all waterbodies to be removed from Category 5A due to segmentation changes for the 2008 cycle. IDEM removed a total of forty eight (48) impairments from Category 5A as a result of resegmentation. It is important to note that the original assessments for all AUs that were split were reevaluated, applied to the resulting new AUs as appropriate and added back to the list in Table A9 (Attachment A) associated with their new AUIDs. Most of the impairments identified in Table A9 are the result of routine assessments. Some some are the result of segmentation changes associated with these assessments and others are newly identified impairments on existing AUs. A key is provided with Table A9 to distinguish between these two types of additions.

Waterbody Impairments Removed from Category 5A on the Basis of Information Received after the 2006 303(d) List was Approved

IDEM routinely reviews its 303(d) for errors and omissions and consistency with Indiana's WQS. During development of its draft list, IDEM's review revealed a number of impairments that were proposed for delisting for various reasons. These included impairments for sulfates, cyanide, and total dissolved dissolved solids that were based on changes that appear in Indiana's interim WQS. Upon further consideration, IDEM has decided not to make any changes to its 2008 303(d) list based on Indiana's Interim WQS until they are formally approved by U.S. EPA.

Based on this decision, a total of fifty eight (58) impairments were added back to Category 5A of Indiana's 303(d) List are shown in Table 2 and remain listed as impairments in Attachment A, Table A13. For 2008, IDEM removed a total of fourteen (14) impairments from Category 5 in 2008 based on its review for errors and omissions (Attachment A, Table A6).

Table 2: Impairments originally proposed for delisting based on changes that appear in Indiana's interim WQS. These waters have been added back to Category 5A of Indiana's 2008 303(d) list.

Changes in IDEM's Use Support Criteria for Biological Data

IDEM's use support criteria for fish community and macroinvertebrate community data have undergone significant changes since they were first adopted in 1996. In 2002, IDEM completed its first five-year basin monitoring rotation. With fish community from every major basin in the state, IDEM was able to fully calibrate its criteria to reference conditions in Indiana making them representative and applicable to most streams in the state. Details on the evolution of IDEM's use support criteria for biological data can be found in IDEM's CALM.

IDEM's use support criteria developed in 2002 remain in effect today. IDEM reviewed all aquatic life use support assessments made on the basis of biological data prior to 2002 against the new criteria to identify any waterbodies that were originally assessed as impaired but may now be considered fully supporting. This process began with the 2006 cycle and was completed in 2007.

During development of the 2008 draft list, IDEM proposed delisting a total of sixteen (16) biological community impairments based on changes in the criteria for determining use support. Since the draft list was published, IDEM has become aware of more recent data that may differ from IDEM's reassessment results for the reach of the Grand Calumet River originally proposed for delisting (Table 3). Given this, IDEM decided to add the biological community impairment back to Category 5A of the 303(d) list until these data can be reviewed for assessment purposes (Table A13). For 2008, a total of fifteen (15) biological community impairments were removed from Category 5A on the basis of changes to IDEM's use support criteria. These impairments are shown in Attachment A, Table A7.

Table 3: Grand Calumet River impairment originally proposed for delisting and added back to Category 5A for biological community impairments on the basis of information received after the draft 2008 303(d) list was published.

ADDITIONS TO INDIANA'S 303(D) LIST OF IMPAIRED WATERS

Waterbody Impairments Added to Category 5A as a Result of Routine Assessments

For a stream to be listed IDEM must have representative sampling data for that stream and the data collected must support 303(d) listing. The impairments added to the 2008 303(d) list are located primarily in the Lower Wabash River Basin, the Kankakee River Basin, and the Great Lakes and Ohio River Basins. The Lower Wabash River and Kankakee River Basins were sampled by IDEM in the summer of 2004 and the Great Lakes and Ohio River Basins were sampled in 2005. Through subsequent analysis of the data from these basins, IDEM identified a total of three hundred forty seven (347) impairments to be added to Category 5A on the basis of routine assessments.

These additions are listed in Attachment A, Table A9. Some of these additions were the result of segmentation changes associated with these assessments and others were newly identified impairments on existing AUs. A key is provided with Table A9 to distinguish between each type of addition.

Waterbody Impairments Added to Category 5A on the Basis of Information Received Since the 2008 Draft 303(d) List was Published

During development of its draft list, IDEM's ongoing review of the 303(d) list for errors and omissions resulted in a number of waterbody impairments that were proposed to be added to Category 5A for various reasons. These included five (5) impairments for sulfates that were based on changes that appear in Indiana's interim WQS. Upon further consideration, IDEM has decided not to make any changes to its 2008 303(d) list based on Indiana's Interim WQS until they are formally approved by U.S. EPA.

Based on this decision, the five (5) impairments originally proposed to be added to Category 5A for sulfates will not be added to the State's 303(d) list until the WQS are approved and the use support status of these waters with respect to sulfate can be ascertained. These waters are shown in Table 4.

For the 2008 cycle, a total of sixteen (16) impairments were added to Category 5A of Indiana's 303(d) list based on information received since the 2006 303(d) list was approved. These impairments are shown in Attachment A, Table A10 and in the Category 5A list shown in Table A13.

Table 4: Waters originally proposed for placement in Category 5A based on impairments assessed using Indiana's Interim WQS. These waters will not be added to Indiana's 303(d) list until their use support status can be ascertained using WQS approved by U.S. EPA.

Waterbody Impairments Added to Category 5A Based on IDEM's New Assessment Methodology for Recreational Use of Lakes

In 2007, IDEM developed additional assessment criteria for recreational use support status, specifically within the context of aesthetics, of Indiana's natural lakes and reservoirs. The details regarding this addition to IDEM's use support criteria can be found in the methodology section of this document. A summary of results is presented in this section. Of the approximately one thousand five hundred four (1504) lakes and reservoirs IDEM has in its ADB, the IDEM has identified approximately one hundred fifty (150) for which there appears to be sufficient data to make an assessment (thirty six (36) reservoirs and one hundred fourteen (114) natural lakes). For 2008, IDEM's new recreational use assessments focused primarily on natural lakes. Assessment of the remaining lakes and reservoirs will likely be completed by the 2010 303(d) listing cycle. Based on the assessments completed to date, IDEM has identified added a total of fifty (50) lake impairments to Category 5A for total phosphorus (Table A11).

CHANGES TO INDIANA'S 303(D) LIST OF IMPAIRED WATERS BASED ON IDEM'S NEW METHODOLOGY FOR DETERMINING SUPPORT OF "FISHABLE" USES

Category 5B includes all waterbodies with fishable use impairments. In past listing cycles, fishable use support was determined using the fish consumption advisory (FCA) issued each year by the Indiana State Department of Health. In 2007, IDEM developed a new methodology for determining fishable use support based on the levels of mercury and/or polychlorinated biphenyls (PCBs) in fish tissue. The development of this methodology and the rationale behind it are discussed in detail in IDEM's CALM.

IDEM implemented its new methodology for determining fishable use support of Indiana's waters by conducting a statewide reassessment of all IDEM fish tissue data. The data set reviewed for reassessment was comprised of results from sampling conducted from 1994-2005 and is IDEM's longest ranging and most complete fish tissue data set to date.

Implementation of this new methodology required the development of decision rules regarding how to determine the appropriate distance over which to apply results from a given site. In order to develop these rules and to ensure that they were consistently applied, IDEM's reassessment was conducted in two phases:

Phase 1: Assessments were conducted using GIS software to distinguish between waters for which IDEM had sufficient fish tissue data to make an assessment and those for which there was little or no data to support decision making. This approach provided the necessary starting point for the development of decision rules regarding how to determine the appropriate distance over which to apply results from a given site.

Phase 2: Assessments were finalized by applying the decision rules regarding extrapolations to each waterbody for which there was sufficient data with which to make an assessment.

The results of Phase 1 of IDEM's reassessment process were reported in Indiana's Draft 303(d) list. Although Phase 2 of the reassessment was not complete at the time the draft list was published, IDEM decided to proceed with publication of the Phase 1 reassessment results in order to provide the public an opportunity to review and comment on the revised fish tissue assessment methodology.

IDEM received a number of comments and questions from the public regarding the changes to Indiana's 303d assessment methodology for mercury and PCBs in fish tissue. Public comments received and IDEM's responses are provided in Attachment E of this document. IDEM's decision to publish the results of its Phase I analysis was intended to provide the public with an opportunity to review the revised methodology and provide comments. Each cycle, IDEM continues to refine the 303(d) list during the public comment period, and it is typical that changes to the draft list will occur during and after the public comment period. By following this process, IDEM is able to take the public comments received into consideration before finalizing it for submission to U.S. EPA. This process thus provides for greater public participation in the development of Indiana's 303(d) list.

Phase 2 of the statewide reassessment has been completed. Finalized assessment results are summarized in Table 6 along with the corresponding results from Phase 1 that were published with the draft 303(d) list. During Phase 2, the decision rules developed during Phase 1 were used to determine the appropriate distance over which to apply results from a given site. As a result, a total of six hundred thirteen (613) streams proposed for delisting based on IDEM's Phase I reassessment will remain on the State's 303(d) list. This includes a small number of changes made to lakes assessments as errors in mapping for Phase 1 reassessments were identified and corrected during the Phase 2 review. The Phase 2 reassessment results represent IDEM's finalized assessments and supercede those published in the Draft 303(d) list. Attachment A, Table A14 identifies a total of nine hundred eighty two (982) impairments for mercury and PCBs in fish tissue, which represents Category 5B of Indiana's 2008 303(d) list.

IDEM's finalized assessment results for fishable use support assessments using the new methodology are shown in Figure 2 for mercury and Figure 3 for PCBs. These figures illustrate the changes between Phase 1 and Phase 2 of the reassessment process as a result of application of the decision rules developed in Phase 1. The decision rules regarding extrapolation of results were applied only to flowing waters. For lakes, results were aggregated for the purpose of assessment.

Table 5: Summary of 2006 303(d) impairments for having a FCA and the results from IDEM's statewide reassessment including 1) preliminary fish tissue assessments published in the 2008 Draft 303(d) List, and 2) the finalized results incorporated into Indiana's 2008 303(d) List of Impaired Waters.

Summary of Changes

Table 8 summarizes the removals from and additions to Indiana's 303(d) list in terms of individual assessment units. Tables 8 and 10 provide a comparison of the 2006 and 2008 303(d) lists by individual assessment units and by parameter, respectively. Table 9 summarizes the changes to Indiana's 303(d) List of Impaired Waters by impairments. The locations of all assessment units proposed to be removed from Category 5A of the 2008 303(d) list and placed in Cateogories 2 or 3 of Indiana's Consolidated List, to be submitted to U.S. EPA as part of Indiana's Integrated Water Quality Monitoring and Assessment Report by April 1, 2008, are shown in Figure 2. The locations of all impaired assessment units proposed to be added to Category 5A are shown in Figure 3. As a result of these changes, Indiana's 2008 303(d) list contains a total of two thousand six hundred eighteen (2,618) individual impairments compared to two thousand six hundred eighty two (2,682) individual impairments for the 2006 303(d) list (assessment units with multiple impairments are listed once for each impairment).

Attachment A, Table A13 consists of the proposed Category 5A waters, and Table A14 consists of those proposed for Category 5B. Together, these two (2) tables comprise the 2008 303(d) list of Impaired Waters for Indiana. Figure 4 shows the locations of all waters identified on Indiana's 2008 303(d) list.

Table 6: Changes to Indiana's 303(d) List of Impaired Waters in terms of individual assessment units in terms of waterbody type and their associated stream miles or lake acres.

NATURE OF CHANGES TO 2006 303(D) LIST	NUMBER OF STREAM ASSESSMENT UNITS	TOTAL STREAM MILES	NUMBER OF LAKE ASSESSMENT UNITS	TOTAL LAKE ACRES

Table A1: Segmentation tracking table for previously listed Category 5A impairments on assessment units (AUs) that were split and retired for the 2008 cycle. The original AU impairments in this table appear in Table A5 as delistings based on resegmentation, and the new AUs to which these impairments were applied appear in Table A9 as additions to Category 5A of Indiana's 303(d) list. Note that tracking previously listed Category 5B impairments for fishable use (FCA for Mercury and FCA for PCBs) is not necessary because all Category 5B impairments were reevaluated for the 2008 cycle, regardless of whether they were split and retired or not. All AUs removed from Category 5B as a result of this statewide reassessment are identified in Table A9 along with delisting explanations.

Note that tracking previously listed Category 5B impairments for fishable use (FCA for Mercury and FCA for PCBs) is not necessary because all Category 5B impairments were reevaluated for the 2008 cycle, regardless of whether they were split and retired or not. All AUs removed from Category 5B as a result of this statewide reassessment are identified in Table A9 along with delisting explanations.

Table A1: Segmentation tracking table for previously listed Category 5A impairments on assessment units (AUs) that were split and retired for the 2008 cycle. The original AU impairments in this table appear in Table A5 as delistings based on resegmentation, and the new AUs to which these impairments were applied appear in Table A9 as additions to Category 5A of Indiana's 303(d) list. Note that tracking previously listed Category 5B impairments for fishable use (FCA for Mercury and FCA for PCBs) is not necessary because all Category 5B impairments were reevaluated for the 2008 cycle, regardless of whether they were split and retired or not. All AUs removed from Category 5B as a result of this statewide reassessment are identified in Table A9 along with delisting explanations.

Table A2: Waterbody impairments moved from Category 5 to Category 4A of Indiana's Consolidated List for the 2008 cycle based on completion of a TMDL.

TMDL Key to Impairments shown in Table A2:

A. Total Maximum Daily Load for *Escherichia coli (E. coli)* for the Beanblossom Creek Watershed, Brown and Monroe Counties
B. Total Maximum Daily Load for *Escherichia coli (E. coli)* For the Plummer Creek Watershed, Greene County
C. Total Maximum Daily Load for *E. coli* Impairment St. Marys River Watershed and Maumee River, Adams and Allen Counties
D. Total Maximum Daily Load for Impaired Biotic Communities and Nutrients for the Blue Creek/Habegger Ditch and Yellow Creek Watersheds, Adams County
E. Total Maximum Daily Load for *Escherichia coli (E. coli)* for the Richland Creek Watershed, Greene, Monroe, and Owen Counties
F. Total Maximum Daily Load for *E. coli* Impairment Big Blue River Watershed, Henry and Rush Counties
G. Wabash River Nutrient and Pathogen TMDL Development: Public Review Draft
H. Total Maximum Daily Load for *Escherichia coli (E. coli)* for the East Fork Whitewater River Watershed, Wayne, Union, Fayette, and Franklin Counties*
L. Limberlost Creek Watershed Sediment and Nutrient TMDL Development
M. Total Maximum Daily Load for *Escherichia coli (E. coli)* for the Sugar Creek Watershed, Hancock, Henry, Johnson, Madison, and Shelby Counties

Table A3: Waterbody impairments proposed to be moved from Categories 2 or 3 to Category 4A on Indiana's Consolidated List based on the completion of a TMDL. These are waters that were not assessed as impaired and identified on the 2006 303(d) list but were determined to be impaired through reassessments completed as part of the TMDL process.

TMDL Key to Impairments shown in Table A2:

C. Total Maximum Daily Load for *E. coli* Impairment St. Marys River Watershed and Maumee River, Adams and Allen Counties

D. Total Maximum Daily Load for Impaired Biotic Communities and Nutrients for the Blue Creek/Habegger Ditch and Yellow Creek Watersheds, Adams County

E. Total Maximum Daily Load for *Escherichia coli (E. coli)* for the Richland Creek Watershed, Greene, Monroe, and Owen Counties

G. Wabash River Nutrient and Pathogen TMDL Development: Public Review Draft

J. Total Maximum Daily Load for *Escherichia coli (E. coli)* West Fork White River (WFWR) Owen County Tributary Watershed - Owen, Greene, and Monroe Counties

L. Limberlost Creek Watershed Sediment and Nutrient TMDL Development: Public Review Draft

O. Total Maximum Daily Load for *Escherichia coli* (*E. coli*) for the Flatrock-Haw Creek Watershed in Henry, Fayette, Rush, Decatur, Shelby, and Bartholomew Counties

Table A5: Waterbody impairments removed from Category 5A due to resegmentation. Original assessments for all AUs split were reevaluated and applied to the resulting new AUs as appropriate. All impairments here have been applied to one/more resulting AUs and appear in Table A9 as an addition to the list and in Table A13 as Category 5A impairment.

Table A8: Waterbody impairments removed from Category 5B of Indiana's 2008 303(d) list based on IDEM's statewide reassessment for fishable use support. Delistings in the table are keyed to the following explanations:

1. **Fish tissue data indicates that the AU is fully supporting of fishable uses in accordance with IDEM's assessment methodology.**
2. **There is some fish tissue data for the AU but the data are insufficient for assessment purposes. Data requirements for these assessments are outlined in IDEM's assessment methodology.**
3. **IDEM has no fish tissue data to support original assessment. The data used to make the original assessment was collected on a different waterbody and is not representative of this AU.**

Table A8: Waterbody impairments removed from Category 5B of Indiana's 2008 303(d) list based on IDEM's statewide reassessment for fishable use support. Delistings in the table are keyed to the following explanations:

1. **Fish tissue data indicates that the AU is fully supporting of fishable uses in accordance with IDEM's assessment methodology.**
2. **There is some fish tissue data for the AU but the data are insufficient for assessment purposes. Data requirements for these assessments are outlined in IDEM's assessment methodology.**
3. **IDEM has no fish tissue data to support original assessment. The data used to make the original assessment was collected on a different waterbody and is not representative of this AU.**

Table A8: Waterbody impairments removed from Category 5B of Indiana's 2008 303(d) list based on IDEM's statewide reassessment for fishable use support. Delistings in the table are keyed to the following explanations:

1. **Fish tissue data indicates that the AU is fully supporting of fishable uses in accordance with IDEM's assessment methodology.**
2. **There is some fish tissue data for the AU but the data are insufficient for assessment purposes. Data requirements for these assessments are outlined in IDEM's assessment methodology.**
3. **IDEM has no fish tissue data to support original assessment. The data used to make the original assessment was collected on a different waterbody and is not representative of this AU.**

Table A8: Waterbody impairments removed from Category 5B of Indiana's 2008 303(d) list based on IDEM's statewide reassessment for fishable use support. Delistings in the table are keyed to the following explanations:

1. **Fish tissue data indicates that the AU is fully supporting of fishable uses in accordance with IDEM's assessment methodology.**
2. **There is some fish tissue data for the AU but the data are insufficient for assessment purposes. Data requirements for these assessments are outlined in IDEM's assessment methodology.**
3. **IDEM has no fish tissue data to support original assessment. The data used to make the original assessment was collected on a different waterbody and is not representative of this AU.**

Table A8: Waterbody impairments removed from Category 5B of Indiana's 2008 303(d) list based on IDEM's statewide reassessment for fishable use support. Delistings in the table are keyed to the following explanations:

1. **Fish tissue data indicates that the AU is fully supporting of fishable uses in accordance with IDEM's assessment methodology.**
2. **There is some fish tissue data for the AU but the data are insufficient for assessment purposes. Data requirements for these assessments are outlined in IDEM's assessment methodology.**
3. **IDEM has no fish tissue data to support original assessment. The data used to make the original assessment was collected on a different waterbody and is not representative of this AU.**

Table A9: Waterbody impairments added to Category 5A based on new assessments. Some of the delistings were the result of segmentation changes associated with these assessments and others were newly identified impairments on existing AUs. A key is provided below to distinguish between each type of addition.

1. **Newly identified impairment of existing AU**
2. **Newly identified impairment on an AU resulting from resegmentation**
3. **Previously identified impairment applied to a new AU resulting from resegmentation**

Table A9: Waterbody impairments added to Category 5A based on new assessments. Some of the delistings were the result of segmentation changes associated with these assessments and others were newly identified impairments on existing AUs. A key is provided below to distinguish between each type of addition.

1. **Newly identified impairment of existing AU**
2. **Newly identified impairment on an AU resulting from resegmentation**
3. **Previously identified impairment applied to a new AU resulting from resegmentation**

Table A9: Waterbody impairments added to Category 5A based on new assessments. Some of the delistings were the result of segmentation changes associated with these assessments and others were newly identified impairments on existing AUs. A key is provided below to distinguish between each type of addition.

1. **Newly identified impairment of existing AU**
2. **Newly identified impairment on an AU resulting from resegmentation**
3. **Previously identified impairment applied to a new AU resulting from resegmentation**

INDIANA'S CONSOLIDATED ASSESSMENT AND LISTING METHODOLOGY

Regulatory Background

Section 303(d) of the 1972 Federal Clean Water Act (CWA) requires each state to identify those waters that do not meet the state's WQS for designated uses. For these impaired waters, states are required to establish total maximum daily loads (TMDLs) to meet the state WQS. In addition, the USEPA has released guidance recommending that states, territories, and authorized tribes submit an Integrated Water Quality Monitoring and Assessment Report that will satisfy CWA requirements for both the Section 305(b) water quality report and Section 303(d) list of impaired waters. Indiana has integrated this guidance into the IDEM's 303(d) listing methodology.

Indiana Department of Environmental Management's (IDEM's) Surface Water Quality Monitoring Strategy

IDEM has developed a surface water quality monitoring strategy to assess the quality of Indiana's ambient waters. The goals of this monitoring strategy are as follows:

1. Measure the physical, chemical, bacteriological, and biological quality of the aquatic environment in all river basins and identify factors responsible for impairment.
2. Assess the impact of human and other activities on the surface water resource.
3. Identify trends through the analysis of environmental data, and
4. Provide environmental quality assessment to support water quality management programs.

To achieve the goals listed above, IDEM has divided the state into five major water management basins. The monitoring strategy calls for rotating through each of these basins once every five years to monitor Indiana's rivers, streams, and lakes under the following data-collection sampling programs:

- Watershed Monitoring Program.
- Fixed Station Monitoring Program.
- E. coli Monitoring Program.
- Fish Community Monitoring Program.
- Fish Tissue Contaminant Monitoring Program.
- Macroinvertebrate Community Monitoring Program.
- Special Projects.
- Clean Lakes Program.

Designated Uses

IDEM, within the framework of the state's water quality monitoring strategy, monitors and assesses Indiana's surface waters to ensure they meet the state WQS for designated uses. The WQS are designed to ensure that all waters of the state, unless specifically exempted, are safe for full body contact recreation and are protective of aquatic life, wildlife, and human health.

Water Quality Assessment Methodology

Use Support/Impairment status is determined for each stream waterbody using the assessment guidelines provided in the USEPA documents *Guidelines for Preparation of the State Water Quality Assessments (305[b] Reports) and Electronic Updates: Report Contents* (EPA-841-B-97-002A) and the draft *Guidance for 2006 Assessment, Listing, and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act* published as a memorandum on February 22, 2005. Available results from six monitoring result types listed

below are integrated to provide an assessment for each stream waterbody for 305(b) reporting and 303(d) listing purposes[1]:

- Physical or chemical water results
- Fish community assessment
- Benthic aquatic macroinvertebrate community assessments
- Fish tissue and surficial aquatic sediment contaminant results
- Habitat evaluation
- E. coli monitoring results

Hydrologic Unit Areas

Waterbody impairments are identified based on watershed areas known as 14-digit hydrologic unit areas (HUAs). These watersheds range from about 5,000 to 20,000 acres in Indiana. The average 14-digit hydrologic unit area in Indiana is about 12,000 acres or 20 square miles. River miles in a 14-digit watershed are designated as one waterbody. These waters may be broken into smaller AU to properly reflect the water quality assessment. Each lake in a watershed is reported as a separate AU.

Large rivers with over 1,000 square miles of drainage area are tracked by reach of the mainstem within hydrologic unit areas. This way the wadeable streams and nonwadeable streams are separated so that issues such as sampling techniques, which might bias results, can be considered within a class of streams.

Lakes, reservoirs, and wetlands are tracked individually. They are reported with the hydrologic unit area in which they are located whether or not the lake or reservoir is also included as a linear stream feature in the National Hydrography Dataset.

Lake Michigan is tracked both as Great Lake shoreline miles and as a lake with its own United States Geological Survey (USGS) cataloging unit (8-digit hydrologic unit area). The shoreline is assigned mileage units. Lake Michigan as a separate lake AU and is assigned acreage units. Hopefully, separate tracking will lead to better assessment and understanding of the water quality of the Indiana waters of this lake.

Water Quality Assessment Decisions

The water quality assessment process is applied to each data-sampling program. Then the individual assessments are integrated into a comprehensive assessment for each AU by use designation: aquatic life support, fish consumption, drinking water supply, and recreational use. Smaller AU are identified for stream reaches as needed when the assessment for a stream reach differed from the default waterbody segment assessment. Each AU in the 305(b) assessment database corresponds to a linear, polygonal, or point feature in the Indiana Reach Index geo-referenced with the National Hydrography Dataset.

Water quality assessments are done by evaluating and coordinating data from site-specific chemical (water, sediment, and fish tissue), physical (habitat, flow data), and biological (fish community, macroinvertebrates, and E. coli) monitoring of Indiana's rivers, streams, and lakes. Chemical data for toxicants [total recoverable or dissolved metals, polynuclear aromatic hydrocarbons (PAHs), pesticides, ammonia, and cyanide], conventional water chemistry parameters (dissolved oxygen, pH, temperature, and anions), and bacteria (E. coli) were evaluated for compliance with Indiana's WQS (327 IAC 2-1-6 and 327 IAC 2-1.5-8). USEPA 305(b) guidelines were applied to chemical and biological data as indicated in Guidelines for Preparation of the State Water Quality Assessments (305[b] Reports) and Electronic Updates: Supplement (EPA-841-B-97-002B). A complete list of criteria used for use support assessments for aquatic life and human health for the 303(d) listing is provided in Table 1.

Table 1: Criteria for Use Support Assessment for 303(d) Listing.

<table>
<tr><th colspan="3">Aquatic Life Use Support - Rivers and Streams</th></tr>
<tr><td rowspan="3">Toxicants</td><td colspan="2">Metals, pesticides, PAHs, cyanide, ammonia were evaluated on a site-by-site basis and judged according to the magnitude of the exceedance(s) of Indiana's WQS and the number of times the exceedance(s) occurred. For any one pollutant (grab or composite samples), the following assessment criteria are applied to data sets consisting of three (3) or more measurements.</td></tr>
<tr><th>Fully Supporting</th><th>Not Supporting</th></tr>
<tr><td>≤1 exceedance of the acute criteria within a three-year period, and <1 exceedance of the chronic criteria for aquatic life within a three-year period.</td><td>>1 exceedance of the acute or chronic criteria for aquatic life within a three-year period.</td></tr>
<tr><td rowspan="3">Conventional inorganics</td><td colspan="2">Dissolved oxygen, pH, sulfates, chlorides were evaluated for the exceedance(s) of Indiana's WQS. For any one pollutant, the following assessment criteria are applied to data sets consisting of three or more measurements.</td></tr>
<tr><th>Fully Supporting</th><th>Not Supporting</th></tr>
<tr><td>For dissolved oxygen, one/more samples may be <4mg/L, but no more than 10% of all measurements are <5mg/L. For other conventional inorganics, criteria are exceeded in <10% of measurements.</td><td>For dissolved oxygen, one/more samples <4mg/L and more than 10% of all measurements are <5mg/L. For other conventional inorganics, criteria are exceeded in >10% of measurements.</td></tr>
<tr><td>Nutrients</td><td colspan="2">Nutrient conditions were evaluated on a site by site basis using the benchmarks described below. In most cases, two or more of these conditions must be met on the same date in order to classify a waterbody as impaired. This methodology assumes a minimum of three sampling events.
• Total Phosphorus: One/more measurements >0.3 mg/l
• Nitrogen (measured as $NO_3 + NO_2$) -- One/more measurements >10.0 mg/l
• Dissolved Oxygen (DO) -- Measurements below the water quality standard of 4.0 mg/l or measurements that are consistently at/close to the standard, in the range of 4.0-5.0 mg/l or values >12.0 mg/l
• pH measurements -- Measurements above the water quality standard of 9.0 or measurements that are consistently at/close to the standard, in the range of 8.7- 9.0
• Algal Conditions -- Algae are described as "excessive" based on field observations by trained staff.</td></tr>
</table>

Benthic aquatic macroinvertebrate Index of Biotic Integrity (mIBI) Scores (Range of possible scores is 0-8)	**Fully Supporting**	**Not Supporting**
	• mIBI ≥1.8 (for samples collected with an artificial substrate sampler) • mIBI ≥2.2 (for samples collected using kick methods)	• mIBI <1.8 (for samples collected with an artificial substrate sampler) • mIBI <2.2 (for samples collected using kick methods)
Fish community (IBI) Scores (Range of possible scores is 6-60)	IBI ≥36	IBI <36
Qualitative habitat use evaluation (QHEI) (Range of possible scores is 0-100)	The Qualitative Habitat Evaluation Index (QHEI) is not used to determine aquatic life use support. Rather, the QHEI is an index designed to evaluate the lotic habitat quality important to aquatic communities and is used in conjunction with mIBI and/or IBI data to evaluate the role that habitat plays in waterbodies where impaired biotic communities (IBC) have been identified. QHEI scores are calculated using six metrics: substrate, instream cover, channel morphology, riparian zone, pool/riffle quality, and gradient. A higher QHEI score represents a more diverse habitat for colonization of aquatic organisms. IDEM has determined that a QHEI total score of <51 indicates poor habitat. For streams where the macroinvertebrate and/or fish community (mIBI and/or IBI) scores indicate IBC, QHEI scores are evaluated to determine if habitat is the primary stressor on the aquatic communities or if there may be other stressors/pollutants causing the IBC.	
Aquatic Life Use Support – Lakes and Reservoirs		
Indiana Department of Natural Resources surveys of the status of sport fish communities in lakes and information on trout stocking.	**Fully Supporting**	**Not Supporting**
	Supports cold water fishery, including native cisco and stocked trout, or both.	Native cisco population is gone or lake unable to support stocked trout and lake attributes, or both, appear to contribute to warm water fishery condition.
Temperature and pH	Lakes in which thermal modifications have caused an adverse effect on aquatic life and lakes that do not meet Indiana's WQS for pH have been assessed as not supporting of aquatic life use.	
Fishable Use Support (Human Health)		
Available fish tissue data for the most recent 12 years of data collection were evaluated for 305(b)/303(d) purposes for the 2008 cycle. Only waters for which sufficient fish tissue data were available were assessed for fish consumption All samples from a given sampling reach must have results below the benchmarks for mercury and PCBs in order to be assessed as fully supporting, and all waters with a sample result exceeding the benchmark for either mercury and/or PCBs are classified as impaired.		

	Fully Supporting	Not Supporting
Mercury in Fish Tissue	Actual concentration values (including estimated values above the method detection limits) for all samples collected from sampling reach are ≤0.3 mg/kg	One or more actual concentration values (including estimated values above the method detection limits) for samples collected from sampling reach are >0.3 mg/kg
	Fully Supporting	**Not Supporting**
PCBs in Fish Tissue	Actual concentration values (including estimated values above the method detection limits) for all samples collected from sampling reach are ≤0.02 mg/kg	One or more actual concentration values (including estimated values above the method detection limits) for samples collected from sampling reach are >0.02 mg/kg
Recreational Use Support (Human Health) – All waters		
IDEM has two different criteria for recreational use assessments depending on the type of data set being used in making the assessment. For data sets consisting of five equally spaced samples over a 30-day period, we apply two tests, both of which are based on USEPA's Ambient Water Quality Criteria for Bacteria - 1986 (EPA440/5-84-002), which provides the foundation for Indiana's WQS for recreational use. For data sets consisting of 10 or more grab samples where no five of which are equally spaced over a 30-day period, the 10% rule is applied. Specific criteria are provided below.		
	Fully Supporting	**Not Supporting**
Bacteria (E. coli): at least five equally spaced samples over 30 days. (cfu = colony forming units)	Geometric mean does not exceed 125 cfu/100ml and no more than one sample >576 cfu/100ml.	Geometric mean exceeds 125 cfu/100mL.
Bacteria (E. coli): grab samples (cfu = colony forming units)	No more than 10% of measurements >576 cfu/100ml and not more than one sample >2400 cfu/100ml.	More than 10% of samples >576 cfu/100ml or more than one sample >2,400 cfu/100ml.
Drinking Water Use Support – Rivers		
Rivers are designated for drinking water uses if a community water supply has a drinking water intake somewhere along the segment. When IDEM has data for a segment with a drinking water intake, those data are compared to Indiana's WQS to determine if the drinking water use is met. Different criteria are applied depending on whether the segment is located within or outside of the Great Lakes system. The appropriate water quality criteria are applied for specific substances identified in the criteria. Information regarding non-naturally occurring taste and odor producing substances not specifically identified in the criteria are reviewed within the context of a water treatment facility's ability to meet Indiana's drinking WQS using conventional treatment.		

<table>
<tr><td rowspan="3">Toxicants</td><td colspan="2">Metals, pesticides, PCBs, total cyanide were evaluated on a site by site basis and judged according to magnitude of the exceedance(s) of Indiana's WQS for point of water intake and the number of times exceedance(s) occurred. For any one pollutant (grab or composite samples), the following assessment criteria are applied.</td></tr>
<tr><th>Fully Supporting</th><th>Not Supporting</th></tr>
<tr><td>No more than one exceedance of the acute or chronic criteria for human health within a three-year period.</td><td>More than one exceedance of the acute or chronic criteria for human health within a three-year period.</td></tr>
<tr><td rowspan="3">Conventional inorganics</td><td colspan="2">Total dissolved solids, specific conductance, sulfate, chloride, nitrite-N and nitrogen (measured as $NO_3 + NO_2$) were evaluated for the exceedance(s) of Indiana's WQS for point of water intake and the number of times the exceedance(s) occurred. For any single pollutant (grab or composite samples), the following assessment criteria are applied to data sets consisting of three or more measurements.</td></tr>
<tr><th>Fully Supporting</th><th>Not Supporting</th></tr>
<tr><td>No more than one exceedance of the acute or chronic criteria for human health within a three-year period.</td><td>More than one exceedance of the acute or chronic criteria for human health within a three-year period.</td></tr>

<tr><td>Taste and odor substances not present in quantities sufficient to interfere with production of drinking water by conventional treatment</td><td>Taste and odor substances present in quantities requiring additional treatment by the public water supply to prevent taste and odor problems</td></tr>
<tr><th colspan="3">Recreational Use Support (Aesthetics) – Lakes and Reservoirs</th></tr>
<tr><td rowspan="2">Natural Lakes</td><th>Fully Supporting</th><th>Not Supporting</th></tr>
<tr><td>No more than 10% of all TP values >54 ug/L and their associated Chla values <20ug/L</td><td>Less than 10% of all TP values <54 ug/L but their associated Chla values are >20ug/L, and the TSI score for the lake indicates eutrophic (32-46) or hypereutrophic (>47) conditions
Or
More than 10% of all TP values are >54 ug/L with associated Chla values <4ug/L, but the TSI score for the lake indicates eutrophic (32-46) or hypereutrophic (>47) conditions
Or
More than 10% of all TP values are >54 ug/L with associated Chla values >4ug/L</td></tr>
</table>

	Fully Supporting	Not Supporting
Reservoirs	No more than 10% of all TP values >51 ug/L and their associated Chla values are <25ug/L	Less than 10% of all TP values are <51 ug/L but their associated Chla values are >25 ug/L and the TSI score for the lake indicates eutrophic (32-46) or hypereutrophic (>47) conditions Or More than 10% of all TP values are >51 ug/L with associated Chla values <2ug/L, but the TSI score for the lake indicates eutrophic (32-46) or hypereutrophic (>47) conditions Or More than 10% of all TP values are >51 ug/L with associated Chla values >2ug/L
Drinking Water Use Support – Lakes and Reservoirs		
Information on the application of pesticides to surface drinking water reservoirs	Reservoirs or lakes that serve as source water for public water supplies that received pesticide (algaecide) application permits for algae were classified as not supporting because additional treatment by the public water supply was required to prevent taste and odor problems.	
Other Assessments – Lakes and Reservoirs		
Indiana Trophic State Index (TSI)	Nutrients, ammonia, dissolved oxygen, light transmission and light penetration in the water column turbidity, and algae growth were used to determine TSI scores. Trophic scores were used to classify lakes according to their trophic state. Lake trends were also assessed for lakes with two or more trophic scores if at least one of the scores was less than five years old. Trophic scores and lake trends are not used to determine use support status. These assessments are conducted to fulfill Clean Water Act Section 314 reporting requirements for publicly owned lakes and reservoirs.	

CWA Section 314 lakes assessments were based on the Indiana Trophic State (or eutrophication) Index, a modified version of the BonHomme Index developed for Indiana lakes in 1972 (Table 2). This multi-metric index combines chemical, physical, and biological data into one overall trophic score for each public lake and reservoir sampled. Scores range from zero to 75. Lower values reflect lower concentrations of nutrients (Table 3). This information is useful in evaluating watershed impacts on lakes. Declining or extirpated cisco populations and the presence of exotic and potentially toxic blue-green algae species were also considered when evaluating lake water quality for aquatic life use. For drinking water reservoirs, taste and odor was also considered as a potential indicator of other water quality problems within the waterbody.

Table 2: The Indiana Trophic State Index

Parameter	Range	Eutrophy Points
Total Phosphorus (mg/L)	<0.03	0

	Hypereutrophic	≥47 TSI points
	Dystrophic	Lakes with little plant growth despite the presence of nutrients; usually due to high humic conditions

Development of New Assessment Criteria for Recreational Use of Lakes

Historically, IDEM's lakes assessments have largely been limited to CWA Section 314 assessments of lake trends and trophic state. This is been due to the absence of water quality criteria in the state's WQS. Indiana's WQS does contain narrative criteria for all waters of the state. The few designated use assessments made on lakes and reservoirs to date are based primarily on narrative criteria.

On a national scale the number one impairment of lakes and reservoirs has long been identified as nutrients. Given this, USEPA has mandated that states develop and adopt nutrient criteria their WQS. In 2001, EPA published recommended criteria for both causal (total nitrogen and phosphorus) and response (chlorophyll a and turbidity/water clarity) variables USEPA in the federal register (66 FR 1671). These criteria were developed for waterbodies in "aggregated" ecoregions based on the work of Omernik and Gallant (1988). USEPA's ecoregional approach uses lake data from a number of states. The analyses used to derive the criteria applicable to Indiana included only nine Indiana lakes, one natural lake and eight reservoirs. Given this, USEPA's published criteria are not as Indiana-specific as IDEM believes is necessary to provide for accurate assessments of water quality conditions in lakes throughout the state. USEPA recognizes these concerns and encourages states to modify or refine their criteria to reflect conditions on a smaller geographic scale (USEPA, 2000c).

In 2007, IDEM developed additional criteria for assessing recreational use support in lakes and reservoirs within the context of aesthetics in order to more fully assess the water quality condition of Indiana's lakes and reservoirs. It should be noted that new assessment criteria described here does not replace any assessment criteria currently in place for lakes and reservoirs. The assessment criteria for recreational use support with respect to human health remains unchanged as do those used to determine drinking water and aquatic life use support (Table 19).

These new criteria are based on the results of a study conducted by of Limno-Tech, Inc. (LTI). In 2004, IDEM contracted with LTI to recommend potential nutrient water quality criteria for Indiana's lakes based on data collected throughout Indiana over several decades. Under this project, a comprehensive database of lakes data was developed for use in analyzing nutrient relationships for Indiana's lakes. The final report for this study is presently in draft and is

expected to be submitted to IDEM by August 31, 2007. For the purposes of this notice, a summary of the data and analytical methods used and the resulting recommendations are provided here.

IDEM's new phosphorus thresholds for recreational use assessments and the data used to develop them.

The LTI study incorporated used both agency data[2] and volunteer data collected by the Indiana Clean Lakes Program (CLP) from 321 natural lakes and 113 reservoirs from 1989 to 2005. Of the 13,063 individual samples with water quality data, 70% of the samples were collected under the volunteer monitoring program. In order to have sufficient data for robust analyses, it was important to use volunteer data if its reliability could be verified. The Indiana CLP is funded by IDEM's Section 319 grant program and operates under an IDEM-approved Quality Assurance Project Plan (QAPP), which documents the data quality of all data collected under the program[3].

Given the importance of volunteer data to this study, data were examined to determine if there was a significant difference depending on whether the data were collected by volunteers or the agencies. LTI first plotted raw data values against each other. However, it became apparent that averaged data provided a much better representation of potential relationships. For example, Figure 1 shows the growing season (June to August) average of Secchi depth and chlorophyll a (Chla) values for lakes where at least three different sample years of Chla existed. This analysis shows that volunteer data are indistinguishable from agency data, and, therefore, no bias should exist if all datasets are combined. Similar conclusions were reached when LTI made additional comparisons between Secchi depth and total phosphorus and between Chla and total phosphorus. The absence of bias between volunteer and agency data was also confirmed by evaluating lakes where agency and volunteer data were used to calculate summer medians versus lakes where only agency data were available.

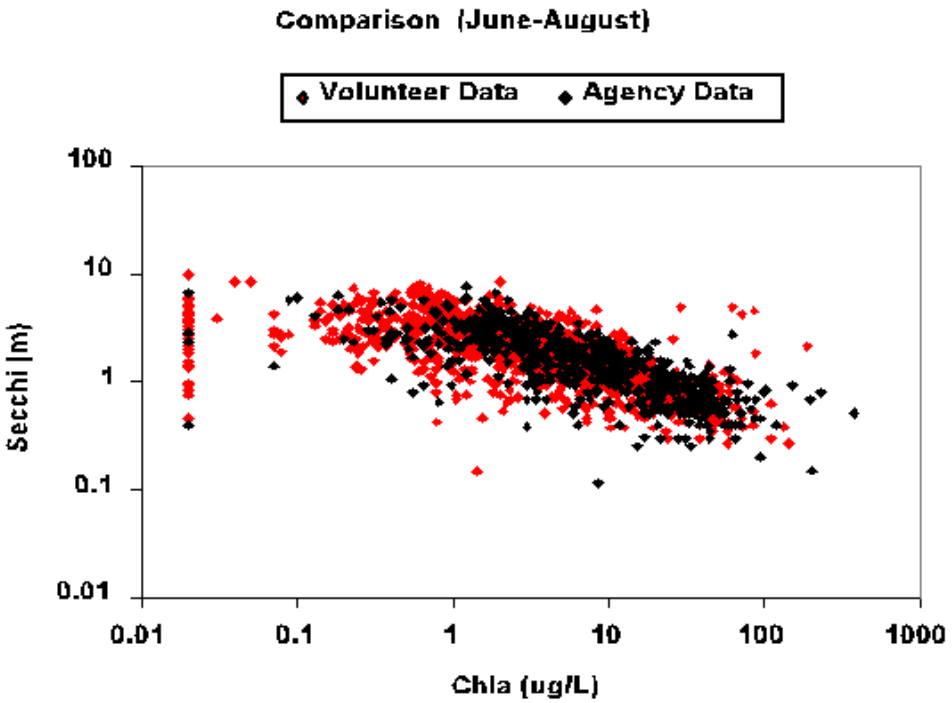

Figure 1: Comparison of volunteer and agency data (Source: LTI, 2007).

Data from all sources were reviewed for quality assurance and evaluated to identify spatial and temporal patterns. Suitable models for developing criteria were evaluated and statistical analyses were applied to establish the recommended total phosphorus thresholds, which are shown in Table 4.

Table 4: Recommended phosphorus thresholds.

Lake Type	Total Phosphorus (ug/L)	Associated Range in Chlorophyll a (ug/L)
Natural Lakes	54	4 to 20
Reservoirs	51	2 to 25

Source: Modified from LTI (2007).

The associated range of Chla represents the range of concentrations that based on LTI's analysis of natural lakes and reservoirs in Indiana that can be expected when total phosphorus concentrations are at or below 54 ug/L or 51 ug/L, respectively.

How the thresholds were determined

Multiple linear regressions analyses were conducted on total phosphorus (as a response variable) for each data set (natural lakes and reservoirs) using regression tree analysis (RTA) methods developed by Soranno, *et.al*, (personal communication). RTA was used to determine appropriate TP thresholds.

Once the TP thresholds were established, median values above and below the threshold for each lake type were calculated for two biological response variables, Secchi depth and Chla. The median values above and below represent the range of expected values for each response variable associated with its corresponding total phosphorus threshold. For example, in Figure 2, the median below line represents the median of all Chla concentration values that fall to the left of the calculated TP threshold whereas the median above line represents all of the Chla values that fall to the right of the threshold (i.e., correspond to TP "exceedances"). A simplified model of how the median values calculated for a given total phosphorus threshold are used to determine recreational use support is provided in the discussion regarding IDEM's assessment methodology for this use (Figure 3).

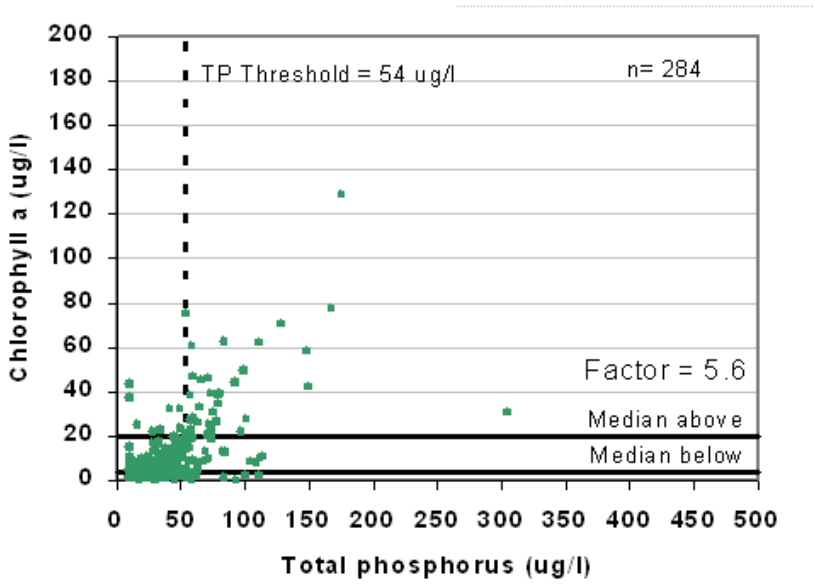

Figure 2: Relationship of Chlorophyll a concentrations to the TP threshold for natural lakes (Source: LTI, 2007).

A biological response factor for Chla was then calculated as the median of the biological response above the threshold divided by the median of the biological response below the threshold. The biological response factor for Secchi depth was calculated as the median of the biological response below the threshold divided by the median of the biological response above the threshold. Based on the work of Soranno, *et al.,* a biological response factor of 2 or greater is considered significant and could reasonably be designated as a relevant TP threshold above which action should be taken.

Table 5 shows that the thresholds calculated are very significant for Chla in both reservoirs and natural lakes. The threshold for Secchi depth in reservoirs, while still significant, is not nearly as strong as the threshold for Chla as indicated by their biological response factors (3.6 for Secchi depth vs. 13.2 for Chla). The same holds true for natural lakes (1.9 for Secchi depth and 5.6 for Chla), and the biological response factor for Secchi depth falls below that which is considered significant for the purposes of setting an appropriate TP threshold.

Table 5: Total phosphorus thresholds and median values above and below the thresholds for natural lakes and reservoirs.

Response Variable	Secchi	Chlorophyll a
Natural Lakes		
Total Phosphorus Threshold (ug/L)	36	54
Median of values above TP threshold	1.2 meters	20 ug/L
Median of values below TP threshold	2.4 meters	4 ug/L
Biological response factor	1.9	5.6
Reservoirs		
Total Phosphorus Threshold (ug/L)	31	51
Median of values above TP threshold	0.8 meters	25 ug/L
Median of values below TP threshold	2.7 meters	2 ug/L
Biological response factor	3.6	13.2

Source: Modified from LTI (2007).

Because the TP thresholds for Chla are much stronger than those for Secchi depth, IDEM's assessment methodology incorporates the total phosphorus thresholds developed for Chla. Other reasons for this decision are that Secchi depth measurements are inherently more subjective than Chla measurements, and IDEM does not have survey data regarding aesthetics, which is necessary to adequately translate secchi depth information into use support status. While there is similarly little analogous information available for Chla, IDEM considers Chla data obtained through laboratory analyses of water samples a more reliable indicator of phosphorus enrichment than secchi depth for the purposes of 305(b) assessment and 303(d) listing decisions.

In some cases, the Chla data were not consistent with expectations given the TP levels measured for a given lake (e.g., low Chla values associated with high TP values or vice versa). For these situations, IDEM's methodology used the TSI score as a surrogate response variable (in addition to Chla) to determine impairment status. The TSI score can be affected by a number of variables in addition to phosphorus (see Table 2). However, the index places additional weight on algal concentration, adding significantly more points where concentrations are high. While the TSI does not provide a direct response variable for TP, it can be a useful indicator in cases where Chla results are mixed.

In addition to providing a surrogate measure for Chla, the TSI score also provides a good measure of overall trophic condition of a given lake. Recognizing the connection between trophic status and nutrient enrichment, USEPA generally considers hypereutrohic conditions as measured by the TSI indicative of impairment (USEPA, 2000c). IDEM does not believe that the TSI score alone is sufficient information for making designated use assessments because it can be affected by a number of variables in addition to nutrient loading. However, in cases where the Chla results are mixed, IDEM used the most recent TSI score to determine impairment. If the TSI score indicates eutrophic or hypereutrophic conditions, the lake was assessed as impaired. It should be noted that TSI scores were not used in absence of Chla results. TSI scores were only reviewed in cases where there were sufficient TP and Chla data but where those data showed conflicting results.

The benchmarks from the LTI study were used to make assessments for recreational uses (as opposed to other designated uses), specifically within the context of aesthetics. Because IDEM does not have sufficient information regarding the response of aquatic communities to nutrient enrichment, these criteria are used to make recreational use support determinations only. These assessments are made within the context of aesthetics as opposed to health risk. Recreational use support assessments for human health are based on pathogen data and are made in the same manner as for rivers and streams when adequate data are available. All impairments identified based on this methodology were assessed as impaired for phosphorus as opposed to nutrients because the LTI study did not include analyses of other nutrient-related parameters.

Figure 3 provides a simplified model of how the median values calculated for a given total phosphorus threshold are used to determine recreational use support. A more detailed discussion is provided in following section.

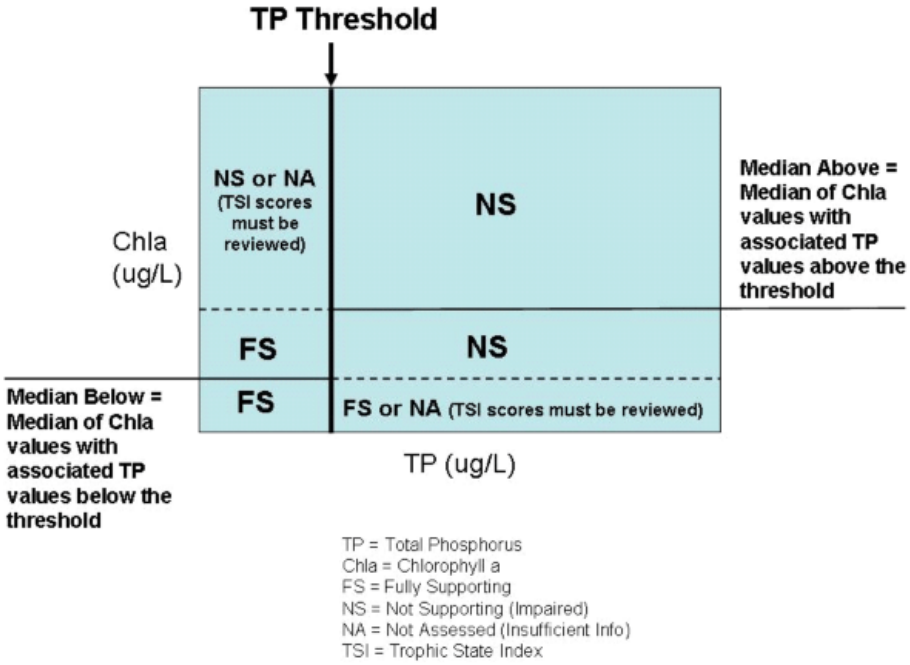

Figure 3: Simplified model of IDEM's assessment methodology using TP data in conjunction with Chla data.

IDEM's assessment methodology using the total phosphorus thresholds

Step 1. Determine the available data to be used for assessment

Indiana's CLP samples 70-80 lakes each year in accordance with a rotating sampling

strategy similar to the rotating basin strategy employed by IDEM for monitoring streams. However, the basin rotation IDEM employs for Indiana's rivers and streams does not work well for lakes given their unequal distribution across the Indiana landscape. While some basins contain very few lakes, others contain more than can feasibly be sampled in a given year. Instead, the Indiana's CLP monitoring rotation for lakes is designed to analyze all public access lakes once every five years. Through this rotation, a given lake is monitored approximately once every five years in July and August with approximately 80 lakes sampled each year. About 400 lakes are thus monitored in a given five-year rotation. In general, only public lakes having an accessible boat launching area were sampled. The July-August period is used because this is the time of year when worst-case scenario and stable conditions (warm temperatures, thermal stratification, hypolimnetic anoxia, and algal blooms are expected).

All available data for a given lake were used for assessment purposes. USEPA guidance suggests that, while all readily available data should be reviewed, 305(b) assessment decisions should be based on data five years old or less. The use of historical data is necessary because the sampling conducted by IDEM's CLP program is designed specifically to support CWA Section 314 assessments of trophic state and lake trends, not to make designated use assessments. As a result, while IDEM's CLP sampling strategy ensures sufficient samples for determining trophic state and trends, a given CLP sampling rotation does not guarantee sufficient data for making designated use assessments. IDEM's benchmark criteria were developed using data from 1989 forward. USEPA recommends that, in general, the method of data gathering for determining compliance (in this case, designated use support) for lakes and reservoirs should be similar to that used to establish the criteria (USEPA, 2000c). CLP data used for designated use assessments includes results from:

- One-time samples collected from public access lakes by SPEA students and analyzed in the CLP laboratory, and
- Monthly TP and Chla samples collected from public and private lakes by trained volunteers and sent to the CLP laboratory for analysis.

Step 2. Determine adequate data for assessment

For purposes of determining recreational use support within the context of aesthetics, the following general rules were applied:

- Only TP and chla data, including volunteer-collected data, analyzed in the CLP laboratory in accordance with the CLP QAPP were used for assessment purposes.
- A minimum of three years' worth of data was considered sufficient for assessment purposes, provided each TP value had a corresponding Chla value.
- Multiple results within a given year for each parameter (TP and Chla) were averaged to provide a single value for that year.
- For consistency in assessments, all samples used in attainment decisions must have been collected during the summer season.

Step 3: Apply benchmark criteria to determine use support

The thresholds shown in Table 4 were applied to all natural lakes and reservoirs for which sufficient data were available. IDEM's methods for applying these criteria are summarized in Table 6 and are illustrated in Figure 6. All waters found to be not supporting of recreational use (aesthetics) were categorized as impaired and placed in Category 5A of Indiana's 303(d) list.

Table 6: Summary of IDEM's assessment methodology for recreational use support within the context of aesthetics.

Recreational Use Support (Aesthetics) – Lakes and Reservoirs		
	Fully Supporting	**Not Supporting**
Natural Lakes	No more than 10% of all TP values >54 ug/L and their associated Chla values are <20ug/L	Less than 10% of all TP values are <54 ug/L but their associated Chla values are >20ug/L, and the TSI score for the lake indicates eutrophic (32-46) or hypereutrophic (>47) conditions Or More than 10% of all TP values are >54 ug/L with associated Chla values <4ug/L, but the TSI score for the lake indicates eutrophic (32-46) or hypereutrophic (>47) conditions Or More than 10% of all TP values are >54 ug/L with associated Chla values >4ug/L
	Fully Supporting	**Not Supporting**
Reservoirs	No more than 10% of all TP values >51 ug/L and their associated Chla values are <25ug/L	Less than 10% of all TP values are <51 ug/L but their associated Chla values are >25 ug/L and the TSI score for the lake indicates eutrophic (32-46) or hypereutrophic (>47) conditions Or More than 10% of all TP values are >51 ug/L with associated Chla values <2ug/L, but the TSI score for the lake indicates eutrophic (32-46) or hypereutrophic (>47) conditions Or More than 10% of all TP values are >51 ug/L with associated Chla values >2ug/L

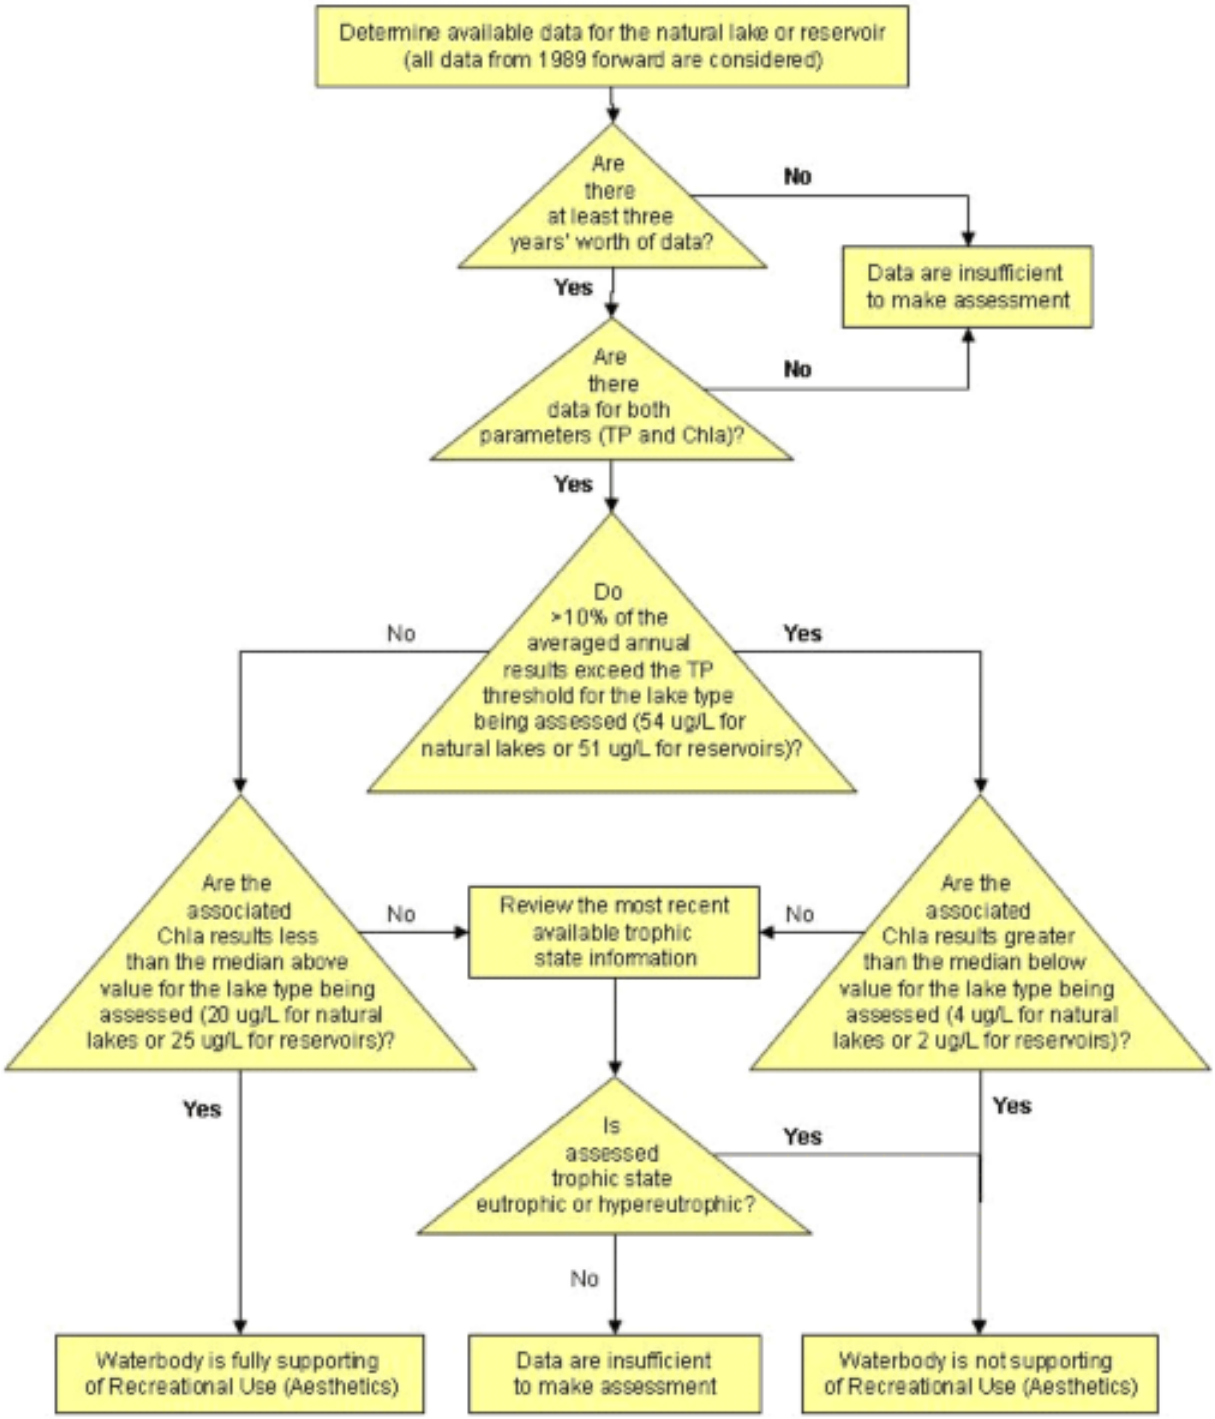

Figure 4: IDEM's assessment process for determining recreational use support for lakes within the context of aesthetics.

Implementation of the new criteria

Of the approximately 1,504 lakes and reservoirs IDEM has in its ADB, the agency has identified approximately 150 for which there appears to be sufficient data to make an assessment (36 reservoirs and 114 natural lakes). For the 2008 cycle, IDEM's new recreational use assessments for lakes have been completed for natural lakes. Reservoir assessments will be completed by the end of 2007 with any resulting impairments added to Indiana's finalized 303(d) list to be submitted by April 1, 2008. Given the robust, Indiana-specific dataset upon which the thresholds recommended in the LTI study were developed, IDEM believes they are appropriate for making designated use assessments and will likely provide the basis for rulemaking to establish nutrient criteria for Indiana's lakes in the future. When IDEM finalizes its nutrient criteria and incorporates them into the state's WQS, IDEM will review all lakes assessments made with the present methodology to determine their consistency with the revised WQS.

Changes to Indiana's Assessment Methodology for Fish Consumption

USEPA "generally believes that fish and shellfish consumption advisories…based on segment specific information demonstrate impairment of CWA section 101(s) 'fishable' uses" and continues to require that IDEM make water quality assessments for fish consumption and place waters with fish consumption advisories on its 303(d) list of impaired waters (USEPA, 2000a). However, Indiana's WQS (WQS) do not contain numeric criteria for the concentration of mercury or polychlorinated biphenyls (PCBs) in fish tissue. IDEM's past and present fish consumption use assessments are a translation of the narrative portion of Indiana's WQS, which states that surface waters "…shall be free from substances in concentrations that on the basis of available scientific data are believed to be sufficient to injure, be chronically toxic to, or be carcinogenic…to humans, animals, aquatic life or plants." (327 IAC 2-1-6 (a)(2)).

Until now, in the absence of numeric criteria for mercury and PCBs in fish tissue, Indiana's 305(b) assessment and 303(d) listing methodology has relied primarily on the state's Fish Consumption Advisory (FCA) published by the Indiana State Department of Health (ISDH). This new methodology results in criteria that are more readily applicable to Indiana's Integrated Report (Sections 305(b) and 303(d)) water quality assessments and will resolve the following issues:

- Indiana's FCA is developed by an interagency workgroup consisting of representatives from the ISDH, Indiana Department of Natural Resources (IDNR), and IDEM. IDEM's role in the development of the FCA is to collect and manage the contaminants data, present the results to the FCA workgroup, and to assist the workgroup in the interpretation of the data. However, final publication of the FCA is the responsibility of the ISDH. Should its publication ever be discontinued IDEM would necessarily have to revise its methodology in order to continue identifying waters that are impaired for their fishable uses pursuant to USEPA's 305(b) and 303(d) policy. Thus, IDEM believes that this change is proactive in nature and ensures a methodology independent of our sister agency's potentially changing mandates.
- Concentrations for assigning FCA groupings, as well as other variables for calculating these concentrations, can change with new scientific information. The advisory groupings shown in the FCA do not include the contaminant concentrations associated with them making it very difficult to determine whether a previous assessment is still valid when such changes occur. Using fish tissue concentration data is more straightforward, making it easier to reevaluate previous assessments as new information becomes available.
- Indiana's FCA was never intended to be used to make designated use assessments under CWA Sections 305(b) and 303(d). There is nothing mandatory or regulatory

about the advice itself. Rather, the FCA is intended to provide the public with important public health information. In contrast, the 303(d) list is a list of waterbodies that do not meet WQS, and for which a Total Maximum Daily Load (TMDL) is required. The groupings shown in the advisory are not designed to and do not translate into WQS. In the interest of achieving greater consistency with goals of CWA Sections 305(b) and 303(d), IDEM believes this change in its methodology for making water quality assessments for fish consumption is in order.

IDEM's 2008 Assessment Criteria for Mercury and PCB Concentrations in Fish Tissue

Mercury

In 2001, USEPA issued a revised human health-based water quality criterion for methylmercury (USEPA 2001). The new criterion is unique among all USEPA (Clean Water Act 304(a)) water quality criteria in that it identifies an acceptable mercury concentration in fish tissue rather than water. A fish tissue criterion is logical because it is fish that are the main source of methylmercury exposure to both humans and wildlife. Also, a tissue-based criterion eliminates the need for a bioaccumulation factor in the criterion calculation, which can be a significant source of uncertainty. The USEPA criterion (USEPA 2001) is 0.3 mg/kg methylmercury in fish muscle tissue. Since nearly 100 percent of the mercury in fish muscle is methylmercury, the criterion can reasonably be considered a total mercury criterion.

Polychlorinated Biphenyls (PCBs)

USEPA has not issued a human health-based criterion for PCBs in fish tissue nor do Indiana's WQS contain a numeric concentration criterion for PCBs in the edible portion of fish tissue. However, Indiana has adopted human health WQS to protect the public from adverse impacts due to 1) exposure through public drinking water supplies withdrawn from surface waters and 2) nondrinking water exposures such as consumption of fish caught in Indiana lakes, rivers, and streams. Although human consumption of sport fish is not explicitly described in Indiana's WQS, criteria for fish consumption are included as part of the calculation of the human health criteria IDEM plans to propose. The fish consumption values in the human health criteria calculation are intended to ensure that the levels of a carcinogenic chemical in fish are not at levels harmful to people who consume them.

Absent a USEPA criterion derived specifically for fish tissue concentration of PCBs, using USEPA's methodology for deriving ambient water quality criteria for the protection of human health (USEPA 2006a) to calculate a concentration value for PCBs is a reasonable alternative that results in a criterion that is more readily applicable to Sections 305(b) and 303(d) water quality assessments than using FCA grouping levels.

Assessment Criteria for Mercury and PCBs Concentrations in Fish Tissue

IDEM's Assessment Criteria for Mercury and PCBs in Fish Tissue

IDEM's revised benchmark criterio for mercury and PCBs in fish tissue is shown in Table 7.

Table 7: WQS-based assessment thresholds for mercury and PCBs.

Mercury (Hg)		
Concentration in Fish Tissue	**Fully Supporting**	**Not Supporting**
	≤ 0.3 mg/kg	> 0.3 mg/kg
Polychlorinated Biphenyls (PCBs)		
Concentration in Fish Tissue	**Fully Supporting**	**Not Supporting**
	≤ 0.02 mg/kg	> 0.02 mg/kg

Relationship of IDEM's WQS-Based Criteria to the FCA

A fish consumption advisory is determined based on the quantity of a chemical in fish, such as milligrams of chemical per kilogram of the edible portion of fish tissue (mg/kg), which is commonly expressed as parts per million (ppm). WQS, on the other hand, are expressed as the quantity of the chemical in water, such as micrograms of a chemical per liter of water (ug/L). The exposure assumptions upon which the human health criteria are based can be used to calculate a maximum safe fish concentration. That fish concentration value can then be directly compared to the values used to issue fish consumption advisories to determine whether the advisory is less or more protective than the WQS.

The levels of fish tissue contaminants that trigger a FCA have little relation to the levels of fish tissue contaminants on which the WQS criteria are based. This discrepancy exists because different assumptions about fish consumption rates and body weight are made in calculating water quality criteria than in issuing FCA. FCAs are intended to provide for protection of human health over a lifetime of exposure, maximizing benefits of eating fish while minimizing the risk. The calculations used to determine if an FCA should be issued are based on contaminant concentration found in fish, which is treated as a constant while consumption rates are allowed to vary. Allowing for different consumption rates makes it possible to safely consume fish that have different levels of contamination. The recommended consumption rate is reduced as fish tissue concentrations increase. To determine a Group 2 advisory, the FCA uses a higher consumption rate (32 g/day) and a lower body mass (22 kg) than the WQS-based criteria calculation (Appendix A), which results in a higher effective exposure in terms of contaminant concentration per unit body mass. These values for consumption and body mass differ because FCA is intended to advise at-risk populations (women who are pregnant or breastfeeding, women who plan to have children, and children under 15 years of age) about how much fish they can safely eat.

In contrast, WQS criteria calculations start with an assumed level of fish consumption and derive a criterion for a safe level given the exposure. Because the consumption rate is held constant, the resulting criterion can be applied consistently to all waters. FCAs are expressed for a given waterbody in terms of certain species within certain size ranges, very few FCAs apply to all fish in a given waterbody, which limits their utility for water quality assessment purposes.

IDEM's new assessment methodology, applicable to all waters, uses the revised human health-based water quality criterion for methylmercury (USEPA 2001) and a criterion for PCBs derived from USEPA's (2000b) human health methodology.

While mindful of the differences in purpose and function of the FCA and the 303(d) list, IDEM's new methodology maintains as much consistency as possible between the protocols ISDH uses to assess data for the FCA and the protocols IDEM uses to assess data for the determination of impairment. For PCBs, the WQS-based threshold is consistent with the one meal per week advice in the FCA, which is equivalent to a Group 2 advisory. However, the threshold for mercury is higher than that which would trigger a Group 2 advisory (Table 8). For mercury, given the existing exposure assumptions upon which the water quality criteria are based, issuance of a FCA does not necessarily indicate an exceedance of WQS.

Table 8: Fish tissue concentrations for levels of consumption advice established by ISDH for mercury and total PCBs and its correspondence to an impairment condition as determine by the WQS-criteria.

Mercury	Fish Tissue Concentration (mg/kg)				
	<0.05	<0.05 – 0.2	0.2 – 1.0	1.0 – 1.9	>1.9
FCA Groups	Group 1	Group 2	Group 3	Group 4	Group 5
Consumption Advice (FCA)	unlimited	1 meal/ week	1 meal/ month	1 meal/ 2 months	No consumption
PCBs	**Fish Tissue Concentration (mg/kg)**				
	<0.05	<0.05 – 0.2	0.2 – 1.0	1.0 – 1.9	>1.9
FCA Groups	Group 1	Group 2	Group 3	Group 4	Group 5
Consumption Advice (FCA)	unlimited	1 meal/ week	1 meal/ month	1 meal/ 2 months	No consumption

*Shaded cells indicate consumption advice that corresponds to nonsupport and an impaired condition using the WQS-based criteria.

IDEM's benchmark criteria do not reflect any determination by IDEM of what an appropriate fish consumption rate should be. The consumption rates expressed in Indiana's WQS for human health are 15.0 g/day for waters in the Great Lakes basin (327 IAC 2-1.5-14) and 6.5 g/day for downstate waters (327 IAC 2-1-8.6).

For mercury, IDEM defaulted to the USEPA water quality criterion for water quality criterion for mercury in fish tissue (USEPA, 2001), which corresponds to one meal per month, or a Group 3 advisory.

For calculating the criterion for PCB in fish tissue, IDEM used the same consumption rate USEPA used to calculate its criterion for mercury in fish tissue for the general population, which is 17.5 g/day national consumption rate. The use of a higher consumption rate in the PCB calculation is consistent with that used by USEPA and results in a more protective criterion than applying the consumption rate expressed for either the Great Lakes basin or downstate waters. The same holds true for mercury. IDEM's decision to use USEPA's criterion value for mercury in fish tissue was a policy decision based on the fact that USEPA's criterion is more protective. Calculations for both criteria are provided at the end of this appendix.

Assessment method using the WQS-based criteria

IDEM's new assessment methodology reflects a conservative approach intended to both identify waters in which fish tissue data indicate impairment for mercury and/or PCBs and to provide for the protection of human health. Using this approach, all samples from a given sampling reach must have results below the benchmarks for mercury and PCBs in order to be assessed as fully supporting, and all waters with a sample result exceeding the benchmark for either mercury and/or PCBs are classified as impaired.

Table 9: Methods for determining fish consumption use support in Indiana waters.

Determining Use Support		
	Fully Supporting	**Not Supporting**
Mercury in Fish Tissue	Actual concentration values (including values above the method detection limits) ıples collected from sampling reach are ≤	One or more actual concentration values (including estimated values above the method detection limits) for samples collected from sampling reach are > 0.3 mg/kg
PCBs in Fish Tissue	Actual concentration values (including estimated values above the method detection limits) for all samples collected from sampling reach are ≤ 0.02 mg/kg	One or more actual concentration values (including estimated values above the method detection limits) for samples collected from sampling reach are > 0.02 mg/kg

The following describes in detail the steps in IDEM's assessment process for fish consumption, which are illustrated in Figure 5.

Step 1. Determine the available data to be used for assessment

Available fish tissue data for the most recent 12 years of data collection were evaluated for 305(b)/303(d) purposes for the 2008 cycle in order to encompass three monitoring cycles in Indiana's rotating basin monitoring strategy (IDEM, 2005). USEPA guidance suggests that, while all readily available data should be reviewed, 305(b) assessment decisions should be based on data five years old or less. The use of historical data is necessary because IDEM's fish tissue sampling program is designed specifically to support the development of the state's FCA, not to make designated use assessments. As a result, while IDEM's sampling strategy ensures sufficient fish tissue samples for developing the FCA, there are not enough samples collected from enough locations each year to conduct a thorough assessment of contaminant levels in fish tissue across the state. Also, most of IDEM's previous assessments for fish consumption were based on data which is now more than five years old. However, to ensure accuracy in Indiana's 303(d) list in 2008 and future cycles, it is necessary to reevaluate all of the data used in all previous assessments using the new methodology. IDEM emphasizes that in completing this reassessment, no waterbody impairment previously identified on Indiana's 303(d) list was proposed for delisting due to the age of the data available for assessment.

Step 2. Determine adequate data for assessment

For purposes of determining fish tissue contaminant concentrations for assessment, the following general rules were applied:

- In order to ensure the most representative data were used for assessment, only samples prepared from the edible portion of fish were utilized.
- One year of sampling was considered sufficient for assessment purposes.
- For waterbodies with data collected in multiple years, species size classes were determined for each year of sampling and treated as individual samples.
- Concentration values less than the analytical method detection limit were considered insufficient for assessment purposes due to the uncertainty associated with such results. It should be noted that for PCBs and mercury, values below the analytical method detection limits do not commonly occur because both contaminants are bioaccumulative in fish tissue.
- Estimated values that are lower than the required quantitation limit[4], which for PCBs

is greater than 0.02 mg/kg, were considered valid for assessment purposes.

- Waterbodies were assessed as fully supporting only if all samples have actual quantitations (i.e., values above the method detection limits) and all were equal to or less than 0.02 mg/kg for PCBs and 0.3 mg/kg for mercury.
- One sample exceeding either criterion with an actual reported concentration was sufficient for the purposes of assessing impairment. This conservative approach is intended to provide greater protection of human health.

Step 3: Apply WQS-based concentration thresholds to determine use support

The WQS-based assessment thresholds shown in Table 21 were applied to all lakes and streams for which sufficient fish tissue data were available. IDEM's methods for applying these criteria are summarized in Table 9. All waters found to be not supporting due to either mercury or PCBs or both were categorized as impaired and placed in Category 5B of Indiana's 303(d) list.

Step 4: Determine the appropriate geographical extent to which the assessment applies

In some cases fish can be very mobile and difficult to attribute to a discrete portion of a lake or river reach. For 305(b)/303(d) assessments, all fish tissue data for a given lake or reservoir were aggregated into a lakewide assessment unless there was evidence that fish from certain parts of a lake are isolated and may have been exposed to different levels of contamination. In determining the appropriate geographical extent to which results can be confidently applied to rivers and streams, a number of factors were considered in a weight-of-evidence approach to the decision making process, including:

- The size and complexity of watershed relative to the amount of data available for decision-making and differences in stream orders within a given watershed;
- The spatial continuity of sampling results across watershed boundaries for a larger streams and rivers;
- Contaminant concentrations and information regarding known sources;
- The types of species sampled (bottom-feeder versus predator) (considered in cases where the data were very limited;
- The relative amount and age of data (in cases where there were conflicting results from different sites along the same assessment unit).

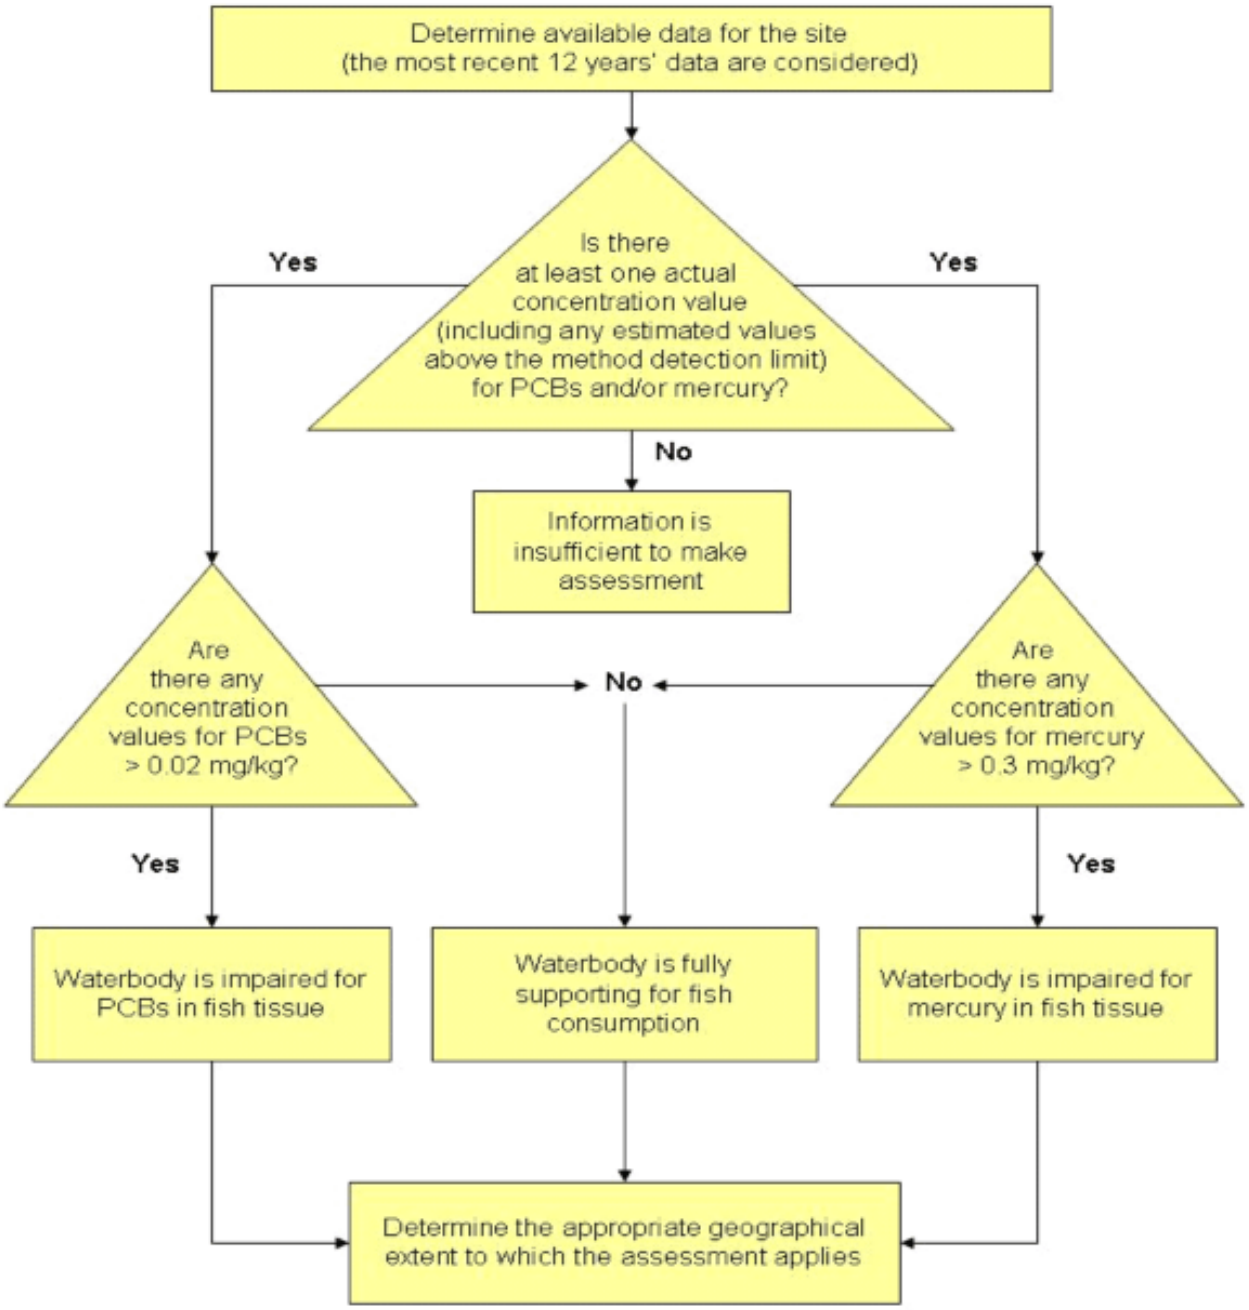

Figure 5: IDEM's assessment process for mercury and/or PCBs in fish tissue.

Implementation of IDEM's new methodology for fish consumption

IDEM implemented this methodology by conducting a statewide reassessment of all IDEM fish tissue data. The data set reviewed for reassessment was comprised of results from sampling conducted from 1994-2005 and is IDEM's longest ranging and most complete fish tissue data set to date. This reassessment was conducted in two phases:

Phase 1: Assessments were conducted using geospatial software (GIS) to distinguish between waters for which IDEM had sufficient fish tissue data to make an assessment and those for which there was little or no data to support decision-making. This approach provided the necessary starting point for the development of decision rules regarding how to determine the appropriate distance over which to apply results from a given site.

Phase 2: Assessments were finalized by applying the decision rules regarding extrapolations to each waterbody for which there was sufficient data with which to make an assessment.

For the 2008 303(d) list, all previously assessed impairments found to be valid using the new assessment methodology remain in Category 5B. However, the impairment for which each has been listed has been changed to more accurately reflect IDEM's new methodology and lend more precision to the meaning of the assessment (Table 10). Previously listed impairments for which the fish tissue data were not sufficient to make an assessment were moved to Category 3 of Indiana's consolidated list. A more complete description of each category and subcategory of Indiana's Consolidated List can be found in the following section of this document entitled "Listing of Waterbody Impairments by Category".

Table 10: Key to changes in how segments are listed for fish consumption impairments.

Fishable use impairment listed under previous methodology	Fishable use impairment listed under new methodology
FCA for Mercury	Mercury in Fish Tissue
FCA for PCBs	PCBs in Fish Tissue

Presently, IDEM assesses for mercury and PCBs in fish tissue. Because IDEM's revised methodology for fish tissue assessments is based on human health criteria, it allows for the calculation of additional criteria for other potentially harmful substances (e.g., dieldrin, DDT, chlordane, and other organochlorine pesticides) that might be found in fish tissue and can be used to identify waters in which fishable uses are impacted by such substances. IDEM has been collecting fish tissue data since the 1970s and has contaminant concentration information for a number of substances in addition to mercury and PCBs. However, because past assessments were based on the FCA, IDEM's ability to assess this information for 305(b)/303(d) purposes was limited to those constituents addressed in the advisory. In future 305(b)/303(d) cycles, IDEM expects to calculate criteria for the additional substances for which the agency has fish tissue data in order to more fully characterize the fishable uses in Indiana's waters and identify those waters that do not support fish consumption.

How to interpret impairments for fish consumption identified on Indiana's 303(d) List of Impaired Waters

IDEM emphasizes that the purpose of the 303(d) list is not to provide the public with a list of waters that they should or should not swim in, or catch and eat fish from. Section 303(d) of the CWA requires that states develop a list identifying impairments to water quality for which a TMDL is required. The 303(d) list is not and was never intended to be a public health advisory. IDEM continues to defer to the Indiana FCA on questions regarding the relative risks of consuming fish caught from Indiana waters and recommends that the public refer to the current

FCA and/or contact the Indiana State Department of Health with any specific questions or concerns in this respect. The current fish consumption advisory can be found online at: http://www.in.gov/isdh/dataandstats/fish/fish_adv_index.htm and contains more specific information than the 303(d) list does regarding the sizes and species of fish that can be safely consumed and how often.

Because IDEM uses the similar methods in determining unsafe levels of mercury and PCBs that ISDH uses in determining fish consumption advice, the concentrations of these contaminants used to determine impairment correspond closely to the meal frequency recommendations published in the FCA. However, it is important to emphasize that one cannot assume, because a particular waterbody does not appear on the 303(d) list for fish consumption that the fish in that waterbody are safe for consumption of more than one meal per week. Likewise, due to the statewide fish consumption advisory for carp, it should not be assumed that carp greater than 15" in length from waters assessed as fully supporting are safe for consumption of more than one meal per month for the general population or at all by at-risk populations. *The 303(d) list is not intended to communicate health risk information.*

At present, adequate translators do not exist for applying concentrations of mercury or PCBs in fish tissue to concentrations in the water column. Toxicants may be present in fish at levels that have no ill effects on aquatic life but due to bioaccumulation may make them unsafe to eat. The concentrations shown in Table 21 apply only to fish tissue, not water. *Therefore, it also should not be assumed that if a waterbody is impaired for fish consumption that mercury and/or PCBs are present in the water column in amounts harmful to human health.*

IDEM's fish consumption use assessments are required by USEPA and are a translation of the narrative portion of Indiana's water quality standard, which states that surface waters "…shall be free from substances in concentrations that on the basis of available scientific data are believed to be sufficient to injure, be chronically toxic to, or be carcinogenic…to humans, animals, aquatic life or plants." (327 IAC 2-1-6 (a)(2)). In addition to resolving the issues associated with using the FCA for assessments, IDEM believes this assessment methodology is consistent with this standard, achieves consistency with the decision making criteria used in developing the FCA, and is consistent with USEPA 305(b) and 303(d) policy guidance.

Changes to IDEM's Use Support Criteria for Biological Data

IDEM's use support criteria for fish community and macroinvertebrate community data have undergone significant changes since they was first adopted in 1996. Table 11 summarizes the evolution of IDEM's criteria for making assessments with biological data. The criteria developed in 2002 are calibrated to reference conditions in Indiana and remain in effect today. However, with the changes in 2002 and each change prior to that time, resulting criteria were applied only to the basins being assessed at the time. In 2007, IDEM completed its review of all aquatic life use support assessments made prior to 2002 to identify any waterbodies that may now be considered fully supporting.

Table 11: Evolution of the criteria used in making aquatic life use assessments with biological data.

Year	Criteria Development and Changes
Monitored: 1996 Assessed: 1997 Reported: 1998	IDEM used Karr's 1986 Index of Biotic Integrity (IBI) Classification and Attributes Table to establish criteria to apply to fish community (IBI) data for use support assessments: • IBI ≥ 44 = Fully supporting (Excellent/Good) • IBI < 44 and ≥ 22 = Partially supporting (Fair/Poor) • IBI < 22 = Not supporting (Very Poor/No Fish) IDEM's criteria for macroinvertebrate community (mIBI) data collected using kick methods: • mIBI ≥ 4 = Fully supporting • mIBI < 4 and ≥ 2 = Partially supporting • mIBI < 2 = Not supporting
Monitored: 1997 and 1998 Reported: 2000	IDEM reviewed fish community data from 1990-1995 (n=831) to determine new, more accurate limits reflective of Indiana fish communities by subtracting ½ standard deviation from the statewide mean to calculate the following criteria: • IBI > 34 = Fully supporting • IBI ≤ 34 and ≥ 32 = Partially supporting • IBI < 32 = Not supporting Criteria for macroinvertebrate community data were unchanged.
Monitored: 1999 and 2000 Assessed: 2000 and 2001 Reported: 2002	Based on IDEM's adoption of USEPA's integrated reporting format, the category for partially supporting was eliminated for both fish community data and macroinvertebrate community data: • IBI ≥ 32 = Fully supporting • IBI < 32 = Not supporting Criteria for macroinvertebrate community data were unchanged.
Monitored: 2001 and 2002 Assessed: 2002 and 2003 Reported: 2004	IDEM completes its first five-year basin monitoring rotation. After reviewing the narrative biological criteria [327 IAC 2-1-3(2)] and water quality standard definition [327 IAC 2-1-9(49)] of a well balanced aquatic community, IDEM determined that IBI values previously considered partially supporting are reflective of poorer conditions and should be classified as not supporting. The resulting criteria are now applied to all basins in Indiana: • IBI ≥ 36 = Fully supporting • IBI < 36 = Not supporting With a more robust set of macroinvertebrate community data, IDEM was also able to calibrate its criteria for this type of data, developing specific criteria applicable to all basins in the state. For samples collected with an artificial substrate sampler: • mIBI ≥ 1.8 = Fully supporting • mIBI < 1.8 = Not supporting For samples collected using kick methods: • mIBI ≥ 2.2 = Fully supporting • mIBI < 2.2 = Not supporting

Biological impairment classifications for streams were based on the sampling and evaluation of either the fish communities or benthic aquatic macroinvertebrate communities, or both. Indices of Biotic Integrity (IBI) for fish and macroinvertebrate IBI (mIBI) assessment scores, or both, were calculated and compared to regionally calibrated models. In evaluating fish communities, streams rating as "fair" or worse were classified as nonsupporting for aquatic life uses. For benthic aquatic macroinvertebrate communities, individual sites were compared to a statewide calibration at the family level of identification for Indiana. All sites at or above background for the calibration were considered to be supporting aquatic life uses. Those sites rated as moderately or severely impaired in the calibration were considered to be nonsupporting. Nonsupport for aquatic life use was considered an impairment of the biological community. Consideration was also given to the size of the stream being assessed. Habitat evaluations were considered in determining the potential for waters to support aquatic communities. If habitat was the primary reason for nonsupport, then the waterbody was not considered for inclusion on IDEM's 303(d) List of Impaired Waters (Category 5) (see Category 4C under "Consolidated Listing Methodology").

Consolidated Listing Methodology

For the development of the 2008 303(d) list, IDEM has followed, to the degree possible, the 305(b) and 303(d) reporting methods outlined in the USEPA's Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act (USEPA, 2005) and the additional guidance provided in the USEPA memorandum Information Concerning 2008 Clean Water Act Sections 303(d), 305(b), and 314 Integrated Reporting and Listing Decisions (USEPA, 2006). The 303(d) list was developed using the 305(b) Assessment Database. Interpretation of the data and listing decisions take into account IDEM's assessment methodologies, USEPA's guidance, and IDEM's 303(d) Listing Methodology. A copy of IDEM's current 303(d) Listing Methodology is included at the end of this document.

Waterbody AU were classified as monitored if surface water quality data used for assessments were not more than five years old or were still considered representative of current conditions. Data from a given monitoring site are considered representative of the waterbody for that distance upstream and downstream in which there are no significant influences to the waterbody that might cause a change in water quality. Using this same rationale, data may also be extrapolated to some distance into tributaries upstream of a given sampling location. Waterbody AU with monitoring site(s) upstream and downstream and those for which reliable assessments can be made based on extrapolation of representative data are classified as monitored. Waterbody AU were classified as evaluated if the primary data used for assessment was more than five years old and little was known concerning changes in the watershed, or the assessment was based on other monitored waterbody AU in the watershed. Only waterbody AU designated as monitored were considered for 303(d) listing purposes. All waterbody AU identified as "Not Supporting" in accordance with the criteria described in Table 18 were considered for 303(d) listing purposes.

Interpretation of the data and 303(d) listing decisions are made in accordance with IDEM's assessment methodologies for the 305(b) report and USEPA guidance. One aspect of USEPA's guidance calls for a comprehensive listing of all monitored or assessed waterbodies in the state, based on the state's assessment and listing methodology. Each waterbody is to be placed in one or more of five categories depending on the degree to which it supports designated uses. Prior to 2006, USEPA required that states place each waterbody into only one category. The draft guidance issued by USEPA in 2005 encourages states to place waterbody AU in

additional categories as appropriate in order to more clearly illustrate where progress has been made in TMDL development and other restoration efforts.

Delineation of these waterbody AU will be based on the National Hydrography Dataset (NHD). The NHD is a database created by USEPA and the USGS that provides a comprehensive coverage of hydrographic data for the United States. It uniquely identifies and interconnects the stream segments that comprise the nation's surface water drainage system. It also contains information for other common surface waterbodies such as lakes, reservoirs, estuaries, and coastlines. States may use spatial resolution on a finer scale than the NHD, and USEPA will translate that resolution into the NHD system. An explanation of the five categories is given below. Indiana's 303(d) List of Impaired Waters will consist of waterbody AU listed in Category 5.

Listing of Waterbody Impairments by Category

Category 1 **Attaining the water quality standard for all designated uses and no use is threatened.** Waters should be listed in this category if there are data and information that meet the requirements of the state's assessment and listing methodology and support a determination that all WQS are attained and no designated use is threatened.

Category 2 **Attaining some of the designated uses; no use is threatened; and insufficient or no data and information are available to determine if the remaining uses are attained or threatened.** Waters should be listed in this category if there are data and information that meet the requirements of the state's assessment and listing methodology to support a determination that some, but not all, designated uses are attained and none are threatened.

Category 3 **Insufficient data and information to determine if any designated use is attained.** Little or no information is available with which to make an assessment. Waters should be listed in this category where the data or information to support an attainment determination for any designated use are not available or are not consistent with the requirements of the state's assessment and listing methodology. States should schedule monitoring on a priority basis to obtain data and information necessary to classify these waters as Category 1, Category 2, Category 4, or Category 5.

Category 4 **Impaired or threatened for one or more designated uses but does not require the development of a TMDL.**

A. A TMDL has been completed that results in attainment of all applicable WQS, and has been approved by USEPA. Monitoring should be scheduled for these waters to verify that the WQS are met when the water quality management actions needed to achieve all TMDLs are implemented.
B. Other pollution control requirements are reasonably expected to result in the attainment of the WQS a reasonable period of time. Consistent with the regulation under 130.7(b)(i),(ii), and (iii), waters should be listed in this subcategory where other pollution control requirements required by local, state, or federal authority are stringent enough to achieve any water quality standard (WQS) applicable to such waters. Monitoring should be scheduled for these waters to verify that the WQS are attained as expected.
C. Impairment is not caused by a pollutant. Waters should be listed in this subcategory if the impairment is not caused by a pollutant but is attributed to other types of pollution for which a total maximum daily load cannot be calculated.

Category 5 The water quality standard is not attained. Waters may be listed in both 5A and 5B depending on the parameters causing the impairment.

A. The waters are impaired or threatened for one or more designated uses by a pollutant(s) and require a TMDL. This category constitutes the Section 303(d) list of waters impaired or threatened by a pollutant(s) for which one or more TMDL(s) are needed. Waters should be listed in this category if it is determined in accordance with the state's assessment and listing methodology that a pollutant has caused, is suspected of causing, or is projected to cause impairment. Where more than one pollutant is associated with the impairment of a single AU, the AU will remain in Category 5 until TMDLs for all pollutants have been completed and approved by USEPA.

B. The waterbody AU are impaired due to the presence of mercury and/or PCBs in the edible tissue of fish collected from them at levels exceeding Indiana's human health criteria for these contaminants. This category also composes a portion of the Section 303(d) list of impaired waters, but the state believes that a conventional TMDL is not the appropriate approach. The state will continue to work with the general public and USEPA on actual steps needed ultimately to address these impairments.

Because each situation is unique, resources, and data sets are sometimes limited, the 2008 listing process may at times require IDEM staff to apply rational professional discretion. Any waterbody AU assessed differently than indicated in the water quality assessment methodology outlined above will be accompanied by written justification, so that stakeholders will understand how each decision was made.

The 2008 303(d) list includes impairments from the 2006 303(d) list that still require TMDL development. For an AU to be listed, it must have been assessed using representative data, and the data must support listing. Any data, both internal or from outside sources, that is used for listing decisions must meet IDEM's quality assurance and quality control (QAQC) requirements as outlined in IDEM's surface water quality monitoring Quality Assurance Project Plan.

Delisting of Impairments

The USEPA's new guidance does not change existing rules for listing and delisting. The existing regulations require states, at the request of the USEPA's Regional Administrator, to demonstrate good cause for not including impairments on the 303(d) list that were included on previous 303(d) lists (pursuant to 40 CFR 130.7(b)(6)(iv)). In general IDEM will only consider delisting an AU one of the following is true:

1. New data indicates that WQS are now being met for the AU under consideration. This would typically occur during IDEM's scheduled assessments when reviewing data collected through our 5-year basin rotation.
2. The assessment and/or listing methodology has changed, and the AU under consideration would not be considered impaired under the new methodology.
3. An error is discovered in the sampling, testing, or reporting of data that led to an inappropriate listing. IDEM will review previous assessments and 303(d) listings when there is there is reason to believe that the original assessment was not valid. Reassessment (review of previous assessment and/or 303(d) listing) typically occurs as a result of ongoing QA/QC of IDEM's Assessment Database (ADB) or through inquiry by IDEM staff or external parties. Under these circumstances, the 305(b)/303(d) coordinator works with the IDEM staff initiating the question or receiving it from the external party

to gather the necessary information and consult with other staff as needed to resolve the question. During reassessment, several types of information are considered, including data quality issues, past assessment methodologies, land use data, historical information from the public, etc. Regardless of the situation, no assessment is dismissed as invalid based solely on the age of the data.

4. If it is determined that another program, besides the TMDL program, is better suited to address the water quality problem, or the problem is determined not to be caused by a pollutant (see Categories 4B[6] and 4C above).

5. A TMDL has been completed, and the waterbody AU is expected to meet WQS after implementation of the TMDL (see Category 4A above).

TMDL Development Schedule and Prioritization

In 2004, IDEM refined its methods of prioritizing waters for TMDL development in order to meet its TMDL goals. IDEM's basin-rotation water quality monitoring schedule continues to be a factor in determining where TMDL development will occur to the extent that it provides data for use in the TMDL. For example, if IDEM is monitoring in a given basin in one year, the data collected will usually be available the following year for incorporation into a TMDL. To take advantage of all available resources for TMDL development, the following additional factors are considered when determining when impairments on the 303(d) list (Category 5) will be scheduled for TMDL development:

1. The quantity and age of available data –AU for which the most current and robust data available will receive greater priority than AU for which data are scarce or nonexistent.

2. The nature of impairment – The three leading causes of impairment to Indiana's waters are impairments due to the presence of mercury and/or PCBs in fish tissue, E. coli, and impaired biotic communities (IBC). To date, states have received little guidance from USEPA regarding how to develop a TMDL to restore a waterbody with elevated levels of mercury and/or PCBs in fish tissue. IDEM has placed all fish tissue impairments in a separate category of the list (5B) because it does not believe that, at this point in time, a conventional TMDL is the appropriate approach for addressing these impairments. Until adequate guidance is available, IDEM believes it to be more prudent to focus its limited resources on developing TMDLs on impairments for which appropriate methods have been established.

3. Other activities occurring in the watershed which may improve water quality if given sufficient time – TMDL development for impairments to waterbody AU where other interested parties, such as local watershed groups, may be working to alleviate the water quality problem may be delayed to give these other actions time to have a positive impact on the waterbody. If WQS still are not met, then the TMDL process will be initiated.

In keeping with the need to make the best possible use of limited resources, IDEM's primary focus in the short term is on E. coli. IDEM has established an effective method for developing E. coli TMDLs and will continue to use this method to address the second leading cause of impairment to Indiana's surface waters. IBC, which is the third leading cause of impairment of surface waters is more difficult to address because IBC are actually a symptom of other unidentified stressors in the environment, which may include a combination of pollution, for which no TMDL would be required, and one/more pollutants. IDEM continues to explore different methods of source identification through its second-year studies program and has plans to complete additional TMDLs over the next two years for a number of IBCs and other impairments, including nutrients, sulfates, total dissolved solids, dissolved oxygen, pH, nickel, zinc, and copper.

Waterbodies on the 2008 303(d) list are scheduled to complete the TMDL development

process within 15 years. Since the CWA does not clearly define the timeline for TMDL development, USEPA, in response to the Federal Advisory Committee Act (FACA) Committee's recommendations, issued guidance for states to develop expeditious schedules of not more than eight to 15 years. 40 CFR section 130.7 also dictates that the 303(d) list specifically include the identification of waters targeted for TMDL development in the next two years. This list is currently being developed and will be submitted to USEPA with Indiana's finalized 303(d) List of Impaired Waters by April 1, 2008.

[1] IDEM staff from the following program areas were involved in the evaluation of Indiana's waterbodies: the TMDL Group, Biological Studies Section, Water Quality Surveys Section, and Water Quality Standards Section. Staff from other program areas were consulted where appropriate.
[2] Agency data used included those collected by Indiana Department of Environmental Management (IDEM), U.S. Environmental Protection Agency (USEPA), and the Army Corps of Engineers (ACOE).
[3] A fact sheet providing more detailed information on Indiana's Clean Lakes Program (CLP) can be found online at: http://www.in.gov/idem/programs/water/quality/biostud/index.html.
[4] The required quantitation limit depends on the specific contract laboratory conducting the analyses and methods used. All methods and their associated quantitation limits are specified in IDEM's Quality Assurance Project Plan

for Indiana Surface Water Quality Monitoring and Total Maximum Daily Load (TMDL) Program (IDEM, 2004).
[5] IDEM's fish tissue monitoring methods are described in detail in the agency's Biological Studies Section Standard Operating Procedures (IDEM, 1992).
[6] A decision to list a water in Category 4B using §130.7(b)(1)(i) must be supported by the issuance of technology-based effluent limitations required by Sections 301(b), 306, 307 or other sections of the CWA. A decision to list in Category 4B using §130.7(b)(1)(ii) must be supported by the issuance of more stringent effluent limitations required by federal, state or local authority. EPA expects that the state will provide a rationale for why they believe that these effluent limits will achieve WQS within a reasonable period of time. Placement of waters in Category 4B based on §130.7(b)(iii) must be supported by the existence of "other pollution control requirements (for example, best management practices) required by local, state, or federal authority" that are stringent enough to implement WQS. EPA expects that the state will demonstrate that these control requirements will achieve WQS within a reasonable period of time.

DERIVATION OF CRITERIA VALUES FOR CONCENTRATIONS OF MERCURY AND PCBS IN FISH TISSUE

USEPA stipulates that the risk assessment parameters used to categorize fish tissue contaminant data must be at least as protective as those used in the WQS-based fish concentrations. The equation for calculating a fish tissue criterion for PCBs utilizes the guidance provided by USEPA for calculating screening values for target analytes (http://www.epa.gov/waterscience/fishadvice/volume1/v1ch5.pdf). EPA's Office of Water recommends the use of this calculation method because it is the basis for developing current water quality criteria for the protection of human health. The general equation used for calculating Screening Values (SVs) for carcinogens in fish tissue is derived from this guidance and is as follows:

$$SV_c = [(RL / CSF) \bullet BW] / CR \qquad \text{Equation 1}$$

where:

SV_c = Screening value for a carcinogen (mg/kg; ppm)
RL = Maximum acceptable risk level (dimensionless)
CSF = Oral cancer slope factor $(mg/kg\text{-}d)^{-1}$
BW = Mean body weight of the general population (kg)
CR = Mean daily consumption rate of species of interest (kg/d)

In determining a screening value or fish tissue criterion for PCBs, the same assumptions and parameters used for calculating human health water quality criteria were applied. These parameters include a BW of 70 kg, CSF (of 2.0 $(mg/kg\text{-}d)^{-1}$, RL of 10^{-5}, and CR of 17.5 (g/d).

The general equation for calculating a fish tissue screening value for PCBs is:

$$Fish\ Tissue\ Screening Value\left(mg/kg\right) = \frac{\left[\frac{Cancer\ Risk\ Level}{q1^{*}\left(\left(mg/kg/d\right)^{-1}\right)}\right] \times Body\ Weight\ \left(kg\right)}{Fish\ Consumption\ \left(kg/d\right)} \qquad \text{Equation 2}$$

Therefore,
Cancer risk level (the RL value from equation 1) = 10^{-5}
$q1$ (the CSF from equation 1) = of 2.0 $(mg/kg\text{-}d)^{-1}$
BW (same in both equations) = 70 kg
Fish Consumption (CR in equation 1) = 17.5 (g/d) or 0.0175 (kg/d)

$$PCB\ Fish\ Tissue\ Screening Value\left(mg/kg\right) = \frac{\left[\frac{1E-05}{2.0\ \left(mg/kg/d\right)^{-1}}\right] \times 70\ \left(kg\right)}{0.0175\ \left(kg/d\right)} = 0.02\ \left(mg/kg\right)$$

A tissue-based criterion eliminates the need for a bioaccumulation factor in the criterion calculation while PCB exposure from drinking water is negligible (http://www.great-lakes.net/humanhealth/lake/superior.html).

STATUS OF CATEGORY 4 WATERS AS OF APRIL 1, 2008

In accordance with USEPA guidance[1], Indiana's Category 4 waters are identified in Indiana's Consolidated List, which is included in Indiana's 2008 Integrated Monitoring and Assessment Report, Appendix B. Category 4 consists of impairments for which a Total Maximum Daily Load (TMDL) is not required. The subcategories of Indiana's Category 4 list are described below:

- Category 4A consists of impairments for which a TMDL has been approved by USEPA and is expected to result in attainment of all applicable WQS.
- Category 4B consists of impairments for which other pollution control requirements are expected to result in the attainment of the WQS in a reasonable period of time.
- Category 4C consists of impairments that are not caused by a pollutant and as such, do not require a TMDL.

Categories 4 and 5 of IDEM's Consolidated List together provide the most comprehensive assessment of impairment of Indiana waters to date. With each 303(d) listing cycle, USEPA requests an update on the status of Indiana's Category 4 waters to facilitate tracking of all known impairments. These impairments and their current status are discussed in the following sections.

Category 4A Impairments

Category 4A consists of impairments for which a TMDL has been approved by USEPA and is expected to result in attainment of all applicable WQS. IDEM's progress in TMDL development since the 2006 cycle is discussed in the narrative 303(d) submission. The discussion in this appendix is intended to provide a comprehensive update on all TMDL development to date. Figure 1 shows the locations of all approved TMDLs to date. As of April 1, 2008, IDEM has developed five hundred twenty four (524) TMDLs now approved by USEPA. There are another five hundred forty eight (548) TMDLs either in progress or planned for the 2010 cycle (Table 1). IDEM's two-year TMDL development schedule is located in Appendix C of IDEM's 2008 303(d) submission.

[1] For the development of Indiana's Consolidated List, IDEM follows, to the degree possible, the 305(b) and 303(d) reporting methods outlined in the U.S. EPA's *Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act* (U.S. EPA, 2005) and the additional guidance provided in the U.S. EPA memorandum *Information Concerning 2008 Clean Water Act Sections 303(d), 305(b), and 314 Integrated Reporting and Listing Decisions* (U.S. EPA, 2006).

Category 4B Impairments

Category 4B consists of impairments for which other pollution control requirements are expected to result in the attainment of the WQS in a reasonable period of time. As of 2008, IDEM's Category 4B list contains a total of ten (10) impairments. IDEM did not add any impairments to Category 4B for the 2008 cycle.

IDEM originally placed the impairments identified in Table 2 in Category 4B in 2002 based on evidence that the electric generating facilities discharging to these waters were responsible for the thermal impairments identified. The facilities in question have NPDES permits for with thermal discharge limits based on site-specific standards and have contested this decision based on annual reports they had submitted indicating no detrimental effects from their discharges. As a result of this apparently contradictory information, IDEM determined that that additional study was needed to determine whether the monitoring and reporting requirements under section 316(a) were sufficient to ensure a well balanced aquatic community of waters outside the mixing zone. As of the 2004 303(d) listing cycle, IDEM was working with the US Fish and Wildlife Service to develop a protocol to determine if modifications are needed to existing permits to maintain WQS for critical times in the year. In December, 2005, the US Fish and Wildlife Service, through an Interagency Agreement with IDEM, completed a report entitled, *Evaluation and Assessment of Fish Assemblages Near Electric Generating Facilities: with Emphasis on Review of Discharge Submitted Data, Development of the Standard Operation Procedures, and Traveling Zone Assessment* (Simon, 2005). The objectives of this study were:

- To evaluate the information submitted by the industry for compliance with 316(a) requirements,
- To develop standard methods that would provide industrial contractors specific protocols for use in meeting permit monitoring requirements for their heated effluents,
- To conduct traveling zone studies of discharge relationships from selected thermal generating facilities, including specifically two of the three facilities to which the above impairments were attributed.

The Simon study was completed right at the time the 2006 303(d) list was being developed. Since then, IDEM has reviewed the results of this study and has determined that additional monitoring and reporting requirements are necessary under Section 316(a) to ensure a well balanced aquatic community of waters outside the mixing zone. In 2006 and 2007, IDEM renewed permits for most electric generating facility permits, which include additional conditions that require the permittees to submit a new 316(a) demonstration/variance request with the renewal application for the next NPDES permit. In order to be granted a 316(a) variance, these facilities must include a site-specific biological study plan in their request that demonstrates that the variance will not result in biological impairment outside the mixing zone. Variance requests are expected from these facilities within the next five years or less in keeping with IDEM's five-year permit.

Table 2: Category 4B impairments attributed to electrical generating facility discharges.

Table 3 identifies Category 4B impairments attributed to other sources. These waters were placed on in Category 4B in 2004. The identified impairments were attributed to the Picnic Wood Wastewater Treatment Plant, owned by LMH Utilities Corporation and are presently being addressed through IDEM's NPDES program. While the plant continues to have sporadic issues related to maintenance problems, it has maintained an approximately 95% compliance record since the original enforcement case was closed in 1996. In addition, LMH Utilities Corporation was issued a construction permit on February 14, 2006 to upgrade its existing treatment facility at Picnic Wood, located in Bright, Indiana. Construction is scheduled to begin no later than March 1, 2007. The planned upgrades to this facility are expected to be complete and operational by October 31, 2009, which is the expiration date of the construction permit. After the upgrades to this facility are complete, it is anticipated that the biological communities will recover and these waters will meet the water quality standard for chlorides in the future.

IDEM has verified that the planned upgrades to this facility were completed in late 2007, and IDEM inspectors report no recent enforcement issues. It is anticipated that these upgrades will result in the attainment of water quality standards within a few years. However, these impairments will remain in Category 4B through the 2010 303(d) listing cycle to allow time for IDEM to conduct the monitoring necessary to verify that they no longer exist.

Category 4C Impairments

IDEM did not add any impairments to Category 4C for the 2008 cycle. To date, Category 4C consists of twenty five (25) impairments that are not caused by a pollutant and as such, do not require a TMDL. These are impairments resulting from stressors for which a load cannot be calculated. Category 4C impairments and their sources are shown in Table 4. Athough a TMDL is not required for these impairments, IDEM may conduct additional monitoring on these waters

through its rotating basin monitoring schedule.

Table 4: Indiana's Category 4C impairments.

2008 303(d) List Summary of Public Comments

Indiana Department of Environmental Management (IDEM) requested public comment from September 26, 2007 through January 31, 2008, regarding the 2008 Draft 303(d) List. IDEM received comments from the following parties:

Alliance for the Great Lakes (AGL)
Deborah Chubb (DC)
Kelly Flood (KF)
Peabody Energy (PE)
Save the Dunes Conservation Fund (SDCF)
Save the Dunes Council (SDC)
Susan MiHalo (SM)
United States Steel Corporation, Gary Works (USSC)
Walt Flood IV (WF)

The following is a summary of the comments received and IDEM's responses thereto:

Fish Tissue Assessment Methodology and Delistings

Comment: Waterways segments listed on the 2006 303(d) List should not be delisted based on spot identification of contaminated fish. (DC)

Response: The delisting proposed in the draft 2008 303(d) list Notice of Comment was the result of the first phase of a two-step reassessment process through which all of the fish tissue data collected throughout the state were reviewed against the criteria for PCBs and mercury in fish tissue in IDEM's Consolidated Assessment and Listing Methodology (CALM). To characterize these assessments as "spot identification of contaminated fish" is incorrect as it implies that IDEM applied results to the smallest geographical extent possible in its assessments. This is not the case. The preliminary assessments reflected in IDEM's draft 303(d) list were conducted using geospatial software (GIS) to distinguish between waters for which IDEM had sufficient fish tissue data to make an assessment and those for which there was little or no data to support decision-making. This approach provided the necessary starting point for the development of decision rules regarding how to determine the appropriate distance over which to apply results from a given site, which were then applied during the second phase of the statewide reassessment.

During the initial reassessment of streams, fish tissue data were applied to the stream reach sampled, regardless of its length. For lakes, the data were aggregated and applied to the entire lake, not to the specific area of the lake in which the samples were collected. For both streams and lakes – and regardless of the parameter under consideration – the goal of IDEM's assessment process is to determine the appropriate geographical extent to which sampling results can be considered representative. IDEM decided that a phased approach to assessing the fishable use of waters throughout the entire state using fish tissue data directly was necessary to properly and consistently implement this methodology for the first time.

Comment: IDEM should not remove impaired waters from the 5B Category of the 2008 303(d) List without presenting test data showing the impaired waters are safe [for recreational activities]. (WF)

Response: Category 5B impairments do not identify waters that are unsafe for recreational uses such as surfing, boating, swimming and fishing. Category 5B identifies waters where fish have been found to have high concentrations of PCBs and/or mercury in their body tissue. PCBs and mercury are bioaccumulative chemicals of concern, meaning that they become more concentrated as they make their way up the food chain. At present, adequate translators do not exist for applying concentrations of mercury or PCBs in fish tissue to concentrations in the water column. Toxicants may be present in fish at levels that have no ill effects on aquatic life but due to bioaccumulation may make them unsafe to eat. Given this, high concentrations of mercury and PCBs in fish tissue do not equate to high concentrations of these contaminants in the water column.

Fish consumption is the primary pathway for human exposure to these contaminants. IDEM's criteria concentrations for mercury and PCBs apply only to fish tissue, not water. Therefore, it also should not be assumed that if a waterbody is impaired for fish consumption that mercury and/or PCBs are present in the water column in amounts harmful to human health.

Because exposure occurs primarily through the consumption of fish as opposed to the act of fishing, swimming or other activities involving physical contact with surface waters, IDEM continues to defer to the current FCA and/or contact the Indiana State Department of Health with any specific questions or concerns in this respect. The current fish consumption advisory can be found online at: http://www.in.gov/isdh/dataandstats/fish/fish_adv_index.htm and contains specific information regarding the sizes and species of fish that can be safely consumed and how often. The 303(d) list is not intended to communicate health risk information.

Comment: Use of the USEPA default value for mercury fish tissue contamination is inappropriate as it does not address the potential or local or regional differences in regards to methyl mercury. (AGL)

Response: IDEM's assessment methodology for mercury in fish tissue makes the assumption that all the mercury in the fish tissue is methylmercury, which is conservative with respect to human health. IDEM's assessment methodology uses USEPA's water quality criterion for mercury in fish tissue, which is calculated based on a national average consumption rate. The use of the USEPA's criterion value was a policy decision based on the fact that it provides a more protective criterion than would result if IDEM used the different consumption rates expressed in Indiana's WQS to calculate criteria for the Great Lakes basin and downstate waters (see IDEM's response to the following comment). USEPA's criterion for mercury provides a single, more protective criterion that can be applied consistently throughout the state, regardless of regional differences.

Comment: More protective measures are warranted for mercury and PCBs in fish tissue as the new methodology for fish consumption does not account for the *Great Lakes Water Quality Initiative (GLI)*. (AGL)

Response: The relative protectiveness of Indiana's criteria values for mercury and PCB's in fish tissue is a function of the consumption rates upon which they are based. The consumption rates expressed in Indiana's WQS for human health are 15.0 g/day for waters in the Great Lakes basin and 6.5 g/day for downstate waters. IDEM has made no determination of an appropriate fish

consumption rate to use in calculating benchmarks. For mercury, IDEM defaulted to the USEPA water quality criterion for mercury in fish tissue. For calculating the criterion for PCB in fish tissue, IDEM used the same consumption rate USEPA used to calculate its criterion for mercury in fish tissue for the general population, which is 17.5 g/day national consumption rate. The use of a higher consumption rate in the PCB calculation is consistent with that used by USEPA and results in a more protective criterion than applying the GLI (327 IAC 2-1.5-14) and non-GLI consumption rates (327 IAC 2-1-8.6).

Comment: Stronger mercury concentration requirements are warranted as the criterion of the standard being proposed is less stringent then the Indiana Department of Natural Resources (IDNR). (AGL)

Response: The FCA published by the Indiana State Department of Health (ISDH) and IDEM's 303(d) list differ in their purpose and function. The FCA are issued as a human health advisory to the public while the 303(d) list is intended to identify waters that are impaired for one or more designated uses – the 303(d) list is not a public health advisory and does not contain appropriate information for this purpose. For mercury, given the existing exposure assumptions upon which the water quality criteria are based, issuance of a FCA does not necessarily indicate an exceedance of WQS. This apparent contradiction is due to differences in the exposure assumptions between two different types of decision-making criteria.

FCAs are intended to provide for protection of human health over a lifetime of exposure, maximizing benefits of eating fish while minimizing the risk. The calculations used to determine if an FCA should be issued are based on contaminant concentration found in fish, which is treated as a constant while consumption rates are allowed to vary. Allowing for different consumption rates makes it possible to safely consume fish that have different levels of contamination. The recommended consumption rate is reduced as fish tissue concentrations increase. While this approach serves the purpose of advising the public about where they should limit their consumption of certain fish within certain size ranges, it creates a moving target that is difficult to use for CWA purposes. CWA assessments are intended to identify waters that are impaired. This is difficult to accomplish with any consistency if the definition of impairment varies from waterbody to waterbody as FCA do. Using FCA to make CWA assessments has always been problematic in this way and has led to impairment decisions that, for the most part, are based on one or two species of fish within certain size ranges, which do not accurately reflect the quality of the resource as a whole. IDEM's methods are consistent with CWA purposes because in calculating the criteria, the consumption rate is held constant, resulting in a criterion that can be applied consistently to all waters regardless of species or size ranges.

Comments: Inconsistencies between FCAs and proposed methodology for impairment of mercury and PCBs are likely to create confusion as FCAs should parallel impairment. Using the new WQS could result in a FCA without impairment. (AGL)

Response: The FCA published by the Indiana State Department of Health and IDEM's 303(d) list differ in their purpose and function. The purpose of the FCA is to provide health information directly to the public for use in making informed decisions regarding how much fish caught from Indiana waters they can safely consume. IDEM's 303(d) list identifies waters that fail to support one or more of their beneficial uses in keeping with the CWA. While CWA assessment and impairment decisions are based on the state's WQS, which also take into consideration human health, these decisions are not intended to be public health advisories.

While mindful of these differences, IDEM's methodology maintains as much consistency as possible between the protocols ISDH uses to assess data for the FCA and the protocols IDEM uses to assess data for the determination of impairment. However, FCAs cannot and should not parallel impairment.

FCAs are intended to provide for protection of human health over a lifetime of exposure, maximizing benefits of eating fish while minimizing the risk. In determining whether a FCA should be issued, the essential question is: Given the contaminant concentrations in the fish, how much fish can a person consume and still be safe? Using this approach, it is possible to have high levels of contamination in fish tissue and still safely consume fish. The consumption rate is simply reduced, resulting in the issuance of a FCA. Thus, FCAs are based on a sliding scale and are expressed for a given waterbody in terms of certain species within certain size ranges. It should also be noted that very few FCAs apply to all fish in a given waterbody, which limits their utility for water quality assessment purposes. While they provide important information for the public, FCAs do not adequately characterize the water quality of the resource as a whole. Using a WQS-based criterion does because it determines a safe concentration applicable to the entire waterbody, regardless of the species or their sizes. Thus, IDEM's methodology provides a more holistic assessment than previous assessments based on FCAs.

Comment: Instead of proposing to remove waters impaired with mercury and PCBs, IDEM should propose to collect data more efficiently and ensure testing will be performed every 2 (two) years. (KF)

Response: IDEM's Fish Tissue Contaminant Monitoring Program follows the rotating basin strategy outlined in the agency's Surface Water Quality Monitoring Strategy (SWQMS). Following a rotating basin strategy allows the agency to use its monitoring resources more effectively by focusing efforts in 1-2 major basins each year rather than trying to spread the same resources over the entire state. This approach, which is preferred by USEPA, allows IDEM to provide a comprehensive assessment of the entire state every five years.

With any type of monitoring, the agency must decide whether its goals will be best met by collecting a lot of samples at a few sites, or monitoring a lot of sites, collecting only a few samples at each. The goal of IDEM's Fish Tissue Contaminant Monitoring Program is to get the most intensive coverage possible.

IDEM's Fish Tissue Contaminant Monitoring Program strikes the best balance available, conducting regular sampling of all the major reservoirs, a selection of natural lakes in the State and all the major rivers. The program also monitors at public access points, perceived and known problem areas, and previously unsampled lakes and streams. This monitoring program seeks a balance between understanding the contaminant levels in a wide variety of species (not just sport fish), monitoring for new and emerging contaminant and monitoring for the contaminants that drive fish advisories, some of which are legacies of our past practices. More than two hundred tissue samples are collected annually with more than 1,000 samples across the entire State of Indiana every five years with its SWQMS. From 1990 to the present, we have collected more than 3,300 individual or composite fish tissue samples for analysis from greater than 190 sites across the State of Indiana.

Previous data for mercury and PCBs in fish tissue collected throughout the state indicate very little change in the concentrations of these contaminants in the short term. Monitoring in rotating basins every five years within the cycle of the SWQMS is adequate for detecting change and is therefore a more prudent use of public funds than monitoring every two years.

Comments on IDEM's Consolidated Assessment and Listing Methodology (CALM)

Comment: Waterways listed on the 2006 303(d) List should not be delisted due to a lack of relevant, supporting, or new data. (AGL)(DC)(SM)

Response: IDEM's 303(d) listing processes follow USEPA regulations, which require states to demonstrate good cause for removing waterbody impairments from their 303(d) list that were included on previous 303(d) lists (pursuant to 40 C.F.R. 130.7(b)(6)(iv)). USEPA's "delisting rules" are summarized here:

- *New data indicates that WQS are now being met.*
- *The state's assessment and/or listing methodology has changed, and the waterbody is no longer considered impaired.*
- *The state's WQS have changed and the waterbody is no longer considered impaired.*
- *The original listing was found to be in error.*
- *The state can demonstrate that there are other pollution control requirements in place that are better suited than a TMDL to address the problem.*
- *The impairment is not caused by a pollutant for which a load can be calculated.*
- *A TMDL for the impairment has been approved by USEPA.*

Comment: IDEM violates USEPA guidance by failing to properly use the USEPA 5m alternative for atmospheric mercury. IDEM has failed to include the supporting documentation for listing waters under subcategory 5m. (AGL)

Response: States are not required by USEPA to employ a Category 5m approach in their consolidated assessment and listing processes. USEPA guidance does not reflect statutory requirements. However, IDEM is in the process of evaluating USEPA's Category 5m approach to determine its feasibility and potential benefits.

Comment: It is unclear how IDEM can make changes to the 2008 303(d) List based on revisions to the state's WQS when large National Pollution Discharge Elimination Systems (NPDES) permits, which have been extended by the agency, are still affecting these impaired waters under the old WQS. (SM)

Response: IDEM has made significant headway in eliminating backlogged NPDES permits. By USEPA's definition, a backlogged permit is one which has not been reissued within 180 days of the permit's expiration date. In July of 2005, IDEM had, by USEPA's definition, approximately a 24% backlog of Major Municipal NPDES permits and a 58% backlog of Major Industrial NPDES Permits. As of February 2008, the Indiana NPDES permit backlog, per USEPA's definition, is 0% for Major Municipal permits and 10% for Major Industrial permits.

Changes in water quality standards (WQS) may or may not affect the limits included in an NPDES permit. For example, specific toxicants (i.e., lead, nickel) are typically only included in NPDES permits when there is a known industrial process source to the treatment facility for the specific toxicant. In addition, the NPDES permit may already contain more stringent

limitations for a parameter than the change in a WQS would require. In this instance, the more stringent limitations are retained in accordance with antibacksliding regulations specified in 327 IAC 5-2-10(11)(A), unless a backsliding justification can be made in accordance with 327 IAC 5-2-10(11)(B).

Comment: Waterways listed on the 2006 303(d) List should not be delisted from the 2008 303(d) List based on the 2005 modified WQS, because the modification was not done according to statutory public comment requirements. (DC)

Response: The 2005 rulemaking to amend Indiana's WQS was conducted in accordance with the procedures outlined in Indiana Code (IC 13-14-9) and was subsequently reviewed and approved by the State Attorney General for its adherence to this code. Although proper procedures were followed in the rulemaking process, and the revised WQS standards were passed by Indiana's Water Pollution Control Board, IDEM has decided not to make any changes to its 303(d) list based on water quality criteria that were revised until these Interim WQS are formally approved by USEPA.

Comment: A clearer explanation is needed where the standard free cyanide has replaced total cyanide. The explanation given leads the reviewer to believe impaired waters have been tested for free cyanide, when actually the data regarding free cyanide is presently not available. (SDC)

Response: Although the majority of cyanide data IDEM has collected in the past is available in the form of total cyanide, the agency does have free cyanide data for some surface waters. The explanations provided for the cyanide delistings proposed in the draft 303(d) list were correct. Where it was indicated that the "Data indicates full support per Indiana's WQS", IDEM has free cyanide data that would support delisting under Indiana's Interim WQS. However, since the draft list was published, IDEM has decided not to make any changes to its 303(d) list based on Indiana's Interim WQS until they are formally approved by USEPA at which time, IDEM will reevaluate all cyanide assessments using the appropriate criteria provided in Indiana's approved WQS.

Comment: Representative data used to list impaired waters on the 303(d) List should not be older than 5 (five) years. (PE)

Response: Per USEPA guidance, IDEM uses the most recent five years' worth of data to revise its water quality assessments each year. In the case of a reassessment based on changes to IDEM's methodology, it is important to look at all data, regardless of its age, to determine whether the revised use support criteria would be met if assessed now.

Comment: IDEM should be clear as to exactly which data range was used to make the assessment that site-specific free cyanide criterion was exceeded, and should use the most recent 3 (three) years of data, which would be considered representative of current conditions. (USSC)

Response: IDEM's responses to the two previous comments apply here.

Comment: While the methodology for aquatic life use support may be appropriate when utilizing acute criteria, it is not appropriate to compare a single maximum result from a three-year monitoring window directly to a chronic criterion, and it is not appropriate to disregard criteria averaging periods. (USSC)

Response: Four-day continuous monitoring is very resource intensive. Although IDEM is able to conduct this type of monitoring at a limited number of sites each year, Indiana and most other states are unable to monitor for four continuous days at every site to determine if a chronic water quality criterion is being met. Therefore, to help states make assessments based on available data, USEPA has provided assessment guidance for making 305(b) and 303(d) listing decisions. USEPA will most likely approve listings if a state follows the assessment methodologies or 'decision rules' recommended in the guidance document, and these are consistent with the WQS. IDEM has closely followed the recommendations in this USEPA guidance in developing the decision rules that are applied in assessing Indiana waters for listing and delisting purposes. These rules are described in the Agency's CALM (CALM), which is submitted to USEPA for review with the State's Integrated Report and 303(d) List of Impaired Waters every two years.

Waterbody-Specific Comments

Salt Creek

Comment: Regarding *E. coli* and dissolved oxygen impairments to the tributaries of Salt Creek, Sager's Lake Outlet (sampling site 6), Pepper Creek (sampling site 8), Unnamed Tributary of Salt Creek (sampling site 9), Robbin's Ditch (sampling site 12), and Block Ditch (sampling site 4), data has been collected and submitted to IDEM that is not presently on the 2008 303(d) List but should be considered and incorporated. (SDCF)

Response: IDEM appreciates the submission of these data for the purposes of updating assessments in the Salt Creek watershed. These data were provided to IDEM during the public comment period. In order to determine their usability for assessment purposes, IDEM must first review the project quality assurance project plan. Based on the staff time that would be needed to perform this review and prepare the data for assessment, these data are not considered by IDEM to be readily available for use in the 2008 303(d) listing cycle. However, IDEM's water quality assessments are an ongoing process, and these data will be considered for use in the next update of Indiana's 303(d) list.

Long Lake

Comment: Regarding Long Lake, before delisting, further investigation is warranted as IDEM has indicated it may have been listed by mistake for fish consumption advisory (FCA) for polychlorinated biphenyls (PCBs). (SM)

Response: During the second phase of its statewide reassessment of fish tissue data, IDEM verified that the Agency has no fish tissue data to support listing Long Lake in Porter County as impaired for PCBs in fish tissue. Since the draft list was published, IDEM has become aware of the existence of recent fish tissue data collected by United States Geological Survey (USGS) that may be useful in determining use support. Prior to the 2010 cycle, IDEM plans to work with USGS to obtain these data and review them to determine their usability for assessment purposes.

Busseron Creek

Comment: Regarding the impairment of Busseron Creek for sulfate and TDS, if the Total Maximum Daily Load (TMDL) is not approved by the United States Environmental Protection Agency (USEPA), the impairment should not remain on the Category 4A List as Indiana does not have a WQS for TDS, and a comparison of the sulfate data to the proposed WQS may show the sulfate impairment no longer exists. (PE)

Response: The delistings for sulfates, total dissolved solids originally proposed in IDEM's 2008 draft 303(d) list and the sulfate additions proposed were based on changes that appear in Indiana's Interim WQS. Upon further consideration, IDEM has decided not to make any changes to its 303(d) list based on Indiana's Interim WQS until they are formally approved by USEPA at which time, IDEM will reevaluate all assessments for these parameters using the appropriate and approved criteria.

Black Creek/Brewer Ditch, Indian Creek, and the South Fork Patoka River

Comment: Regarding the sulfate impairment of Black Creek/Brewer Ditch, Indian Creek, and the South Fork of the Patoka River, the representative data submitted for these waterways should be compared to the new WQS before listing these waters as impaired on the 2008 303(d) List. (PE)

Response: IDEM's response to the previous comment applies here.

Comment: Regarding Black Creek/Brewer Ditch, Indian Creek, and the South Fork of the Patoka River, data listed by IDEM showing sulfate impairment is not representative of current conditions, and should undergo an assessment with respect to the new state WQS proposed for adoption from the Illinois Environmental Protection Agency (IEPA). In the event these streams are not impaired with regard to the new water quality standard, they should be removed from the listing for impairment. (PE)

Response: As noted in IDEM's responses to previous comments, IDEM has decided not to make any changes to its 303(d) list based on Indiana's Interim WQS until they are formally approved by USEPA at which time, IDEM will reevaluate all assessments for sulfates using the appropriate criteria provided in Indiana's approved WQS. IDEM cannot legally use another state's WQS because the Federal Clean Water Act requires states to make assessments in keeping with their established and approved WQS, which for Indiana, are codified in the Indiana Administrative Code (IAC 327 Article 2).

Comment: Regarding Impaired Biotic Communities found within Black Creek/Brewer Ditch and the South Fork of the Patoka River, more data needs to be acquired before listing them as impaired. (PE)

Response: The biological impairment of Black Creek/Brewer Ditch was based on a fish community sample collected in 2001, which meets the data requirements outlined in IDEM's CALM for use support determinations. The biological impairment of South Fork Patoka River was added to IDEM's 303(d) list in 1998 based on representative data collected at that time. Per USEPA requirements, this impairment must remain on the 303(d) list until IDEM has monitoring data indicating that the waterbody supports a well-balanced aquatic community.

IDEM's water quality monitoring and it 305(b) assessment and 303(d) listing processes follow a 5-year rotating basin schedule. IDEM conducted additional sampling in the Patoka River basin in 2006. In keeping with the Agency's schedule for 305(b) assessment and 303(d) listing schedule, these data will be reviewed for assessment purposes in 2008, and any resulting changes to the state's 303(d) list will be proposed on IDEM's 2010 draft 303(d) list.

Comment: Regarding Indian Creek and it's tributaries as well as Brewer Ditch's tributaries, data submitted to IDEM regarding Total Dissolved Solids (TDS), a very conservative estimate of the sulfate concentration, suggests both waterways are meeting sulfate WQS. (PE)

Response: As noted in IDEM's response to a previous comment, IDEM has decided not to make any changes to its 303(d) list based on Indiana's Interim WQS until they are formally approved by USEPA at which time, IDEM will reevaluate all assessments for the these parameters using the criteria provided in Indiana's approved WQS.

Grand Calumet River

Comment: Regarding AU INC0122_00 or AU INC0122_ T1097 of the EBGCR, it is unclear as to what data IDEM used to list these segments as impaired for oil and grease. There are no results associated with Fixed Station GCR-42 from 1990-2007 or Fixed Station GCR-46 from 1999-2007, therefore the listing should be moved to Category 3. (USSC)

Response: The Oil and Grease impairments on the Grand Calumet River were originally listed based on 10 years' worth of data collected from fixed stations between 1959 and 1973. The locations for the specific sites used are identified in IDEM's 1977 305(b) Report, available for review through the IDEM Office of Water Quality File Room or by submitting a photocopy request to IDEM's 305(b)/303(d) Coordinator, Jody Arthur. Ms. Arthur can be contacted by phone at 317-234-1424 or by email at jarthur@idem.IN.gov.

USEPA regulations require states to demonstrate good cause for removing waterbody impairments from their 303(d) list that were included on previous 303(d) lists (pursuant to 40 C.F.R. 130.7(b)(6)(iv)). The data upon which these assessments were made were determined to be representative at the time they were collected. In order to delist the oil and grease impairments on the Grand Calumet River, IDEM would need more recent data indicating that these problems no longer exist.

Comment: Regarding AU INC0122_00 of the EBGCR, IDEM should use all valid and available data submitted and more appropriate method for determining use support when comparing daily sample results to chronic criteria for the ammonia. (USSC)

Response: Due to resource constraints, Indiana, like most other states, is unable to monitor for four continuous days at every site to determine if a chronic water quality criterion is being met. USEPA recognizes this and has provided guidance to states to assist them in making 305(b) assessments and 303(d) listing decisions based on the available data, which in many cases are daily results as opposed to four-day averages. USEPA will most likely approve listings if a state follows the assessment methodologies or 'decision rules' recommended in the guidance document, and these are consistent with the WQS. IDEM has closely followed the recommendations in this USEPA guidance in developing the decision rules that are applied in assessing Indiana waters for listing and delisting purposes. These rules are described in the Agency's CALM, which is submitted to USEPA for review with the State's Integrated Report and 303(d) List of Impaired Waters every two years.

Regarding the use of all available data, IDEM reviews all readily available data submitted for potential use in the Agency's 305(b) assessment and 303(d) listing processes. IDEM is also working to determine the usability of water quality data submitted to other Agency programs in its 305(b)/303(d) assessment processes. However, based on the volume and variety of these data in terms of the format in which they are submitted and their relative data quality, IDEM does not presently consider these data readily available.

However, IDEM recognizes the potential value inherent in all water quality data to the Agency's 305(b) assessment and 303(d) listing processes and is currently developing a framework for the solicitation, review, and potential use of external data in these processes. It is anticipated that when this framework is fully developed and implemented, IDEM 's ability to review data sets from all external source will be significantly improved.

Comment: After reviewing free cyanide data for the Grand Calumet River (GCR) provided by IDEM along with a corresponding site key, it is unclear which locations of the river are impaired for free cyanide. IDEM should review the delisting of the Grand Calumet River (GCR) for free cyanide as recent data provided by the agency appears to indicate many exceedances. (AGL)

Comment: In accordance with 327 IAC 2-1.5-16 site specific criteria for cyanide are applied from USS outfall 005 to one mile downstream. IDEM should use these criteria in assessing use support for that part of the segment INC0122_00. (USSC)

Comment: Regarding AU INC0122_00 of the EBGCR, the impaired designation can be made after IDEM collects data from representative sampling locations using the Indiana site specific criteria for free cyanide. (USSC)

Comment: Data for the most recent 3 years post-dredging should be used for the cyanide assessments. (USSC)

Comment: USS data for AU INC0122_00 with supporting documentation was submitted to IDEM in 2002 this combined with IDEM's 1999-2000 TMDL and the data generated for the 401 Certification and this should be compared to the free cyanide criteria. The USS DMR reports for outfall 005 and 010 show no exceedance of WQS and therefore it can be assumed that the cyanide criteria is being met instream and the segment does not warrant the impairment listing. (USSC)

Response: This response applies to all of the previous five comments regarding IDEM's Grand Calumet River assessments for free cyanide. The delistings for cyanide originally proposed in IDEM's 2008 draft 303(d) list were based on changes that appear in Indiana's Interim WQS. Upon further consideration, IDEM has decided not to make any changes to its 303(d) list based on Indiana's Interim WQS until they are formally approved by USEPA. At that time, IDEM will reevaluate all data originally used to make these assessments and will work to identify and review other available data for potential usability for assessment purposes. Per USEPA guiadance, the most recent five years' worth of usable data will be considered to ascertain the use support status of the Grand Calumet River using the applicable and approved criterion for cyanide. The issues identified here will be taken into consideration at the time this reassessment is made.

Comment: Regarding AU INC0122_00 of the East Branch of the Grand Calumet River (EBGCR), the impaired biotic community listing should be moved to Category 3. The sample taken would have been included in the dredging area hence the 1996 results would no longer be representative. (USSC)

Response: USEPA regulations require states to demonstrate good cause for removing waterbody impairments from their 303(d) list that were included on previous 303(d) lists (pursuant to 40 C.F.R. 130.7(b)(6)(iv)) and do not allow delisting based solely on the age of the data. The data upon which the original assessment was made were determined to be representative at the time they were collected. In order to delist, IDEM would need more recent data indicating that WQS are now being met.

Since the draft list was published, IDEM has become aware of the existence of more recent biological data that may provide new information with which to determine current aquatic life use support status of the Grand Calumet River. Until these data are obtained and reviewed for their usability for assessment purposes, the Grand Calumet River reach impaired for IBC will remain on Indiana's 303(d) List of Impaired Waters.

Comment: Regarding AU INC0122_00 or AU INC0122_T1097 of the EBGCR, the habitat quality (hIBI) and biological integrity data (mIBI) available are not current and do not represent current conditions. If IDEM has concluded they are impaired for biotic communities due to pollutant(s), then IDEM should identify the pollutants causing the biological impairment and identify the methodology used to determine such a conclusion. (USSC)

Response: IDEM's response to the previous comment applies here. With regard to identifying specific sources for biological impairment, impaired biotic communities (IBCs) are problematic from a water quality management perspective because USEPA requires that they be treated as a cause of impairment for listing purposes when they actually represent the secondary effect of other causes of impairment (i.e. stressors in the watershed). However, in keeping with USEPA policy, IDEM must retain these impairments on the State's 303(d) until their specific sources can be identified. This is usually accomplished through the TMDL process.

However, for the Grand Calumet River, IDEM has determined that developing a TMDL for the multiple impairments on the Grand Calumet River is not appropriate or cost effective at this time. This is because most of the water quality issues identified have been attributed to the presence of contaminated sediments in these waters. Dredging to remove the contaminated sediments is scheduled to begin in 2009 for both waterbodies. It is anticipated that once completed, these dredging projects will resolve most of the impairments presently identified resulting in the attainment of WQS within a reasonable timeframe.

Comment: Regarding the GCR, considering the money being spent to restore it, IDEM should not delist segments with the generic reason of insufficient data as there should be sufficient data. (SM)

Response: The water quality issues in the Grand Calumet River are very well defined and well documented. IDEM's proposed delisting of the Grand Calumet River was not based on a lack of data. Rather, it was based on changes in IDEM's use support criteria for biological data. However, upon further review of that data used to make the original assessment, IDEM scientists determined that the Grand Calumet River should remain listed for IBC until more recent data are available and show that the aquatic communities in the Grand Calumet River are no longer

impaired. The specific reasons for this decision are addressed in IDEM's responses to the following two comments.

Comment: Regarding data collected at LM 020-0017of the EBGCR, if IDEM chooses to use the 1996 biological and habitat data, it should be assessed as stated in the methodology section of the 2008 draft 303(d) List of Impaired Waters, which indicates poor habitat using the QHEI score from the 1996 sampling. (USSC)

Response: In the draft 2008 303(d) list, IDEM proposed delisting one reach of the Grand Calumet River for IBC. This decision was based on changes in the Agency's use support criteria for macroinvertebrate results that have occurred since the original assessment, which was based on data collected in 1996. Based on the current criteria, the 1996 macroinvertebrate community results do not indicate impairment. Upon further review, IDEM biologists have determined that the mIBI sub-metrics have failed to accurately characterize the severity of impairment at the lower end of the calibrated scale of the index and that reverse scoring on some of the sub-metrics is necessary to accurately characterize use support at severely impacted sites.

In addition, after the draft list was published, IDEM became aware of the existence of more recent data that may support the continued listing of the Grand Calumet River for IBC. Given this, IDEM decided to add this impairment back to Category 5A of the 303(d) list until these data can be reviewed for assessment purposes.

Regarding the use of the habitat data, in accordance with IDEM's CALM, IDEM does not use the Qualitative Habitat Evaluation Index (QHEI) to determine aquatic life use support. Rather, the QHEI is an index designed to evaluate the lotic habitat quality important to aquatic communities and is used in conjunction with mIBI and/or IBI data to evaluate the role that habitat plays in waterbodies where impaired biotic communities (IBC) have been identified.

Comment: Regarding AU INC0122_00 or AU INC0122_T109 of the EBGCR, IDEM should further clarify the applicability of the regional reference criteria for biological impairment. IDEM's previous response to this issue did not provide an explanation of how the biological data, or the identification of specific reference streams within the state or region, have been appropriately calibrated to represent a man-made and frequently modified navigational canal system. (USSC)

Response: The Hester-Dendy artificial multi-plate substrate regional reference criteria was determined using 134 samples collected in non-wadeable or non-riffle type habitats from low gradient tributaries, headwater streams to highly modified aquatic systems. Samples collected with this method in these systems were found to have a normal distribution with a mean total taxa richness of 7 to 8 taxa per sampler. The mean percent dominant taxa was found to be no more than 67.0%, and the mean Ephemeroptera, Plecoptera, Trichoptera (EPT) taxa richness was found to be 3 EPT taxa. The highest quality stream systems were found to typically have more then 10 total taxa.

The Grand Calumet system has been found to be one of the lowest scoring systems in the state. The nearby Burns Ditch in Porter County has a typical taxa count of 13 total taxa with a percent of dominance of 20%. The Chicago Lake Plain ecoregion, in which the Grand Calumet is part, should have, based on our calibrations a Hester-Dendy mIBI score of 3 which is significantly higher then the scores we determined for the Grand Calumet. Therefore, the multi-metric score used by IDEM to determine non-attainment is extremely conservative.

Comment: Regarding Assessment Unit (AU) INC0122_00 of the EBGCR, the proposed listing as impairment for ammonia under Category 5 is incorrect. After IDEM has collected data from representative sampling locations, a valid assessment of whether the designated use is impaired by ammonia can be made. Regarding the upper portion of the EBGCR, IDEM should investigate the use of other monitoring locations along this reach to correctly characterize it. (USSC)

Response: The assessment of the headwater portion of the Grand Calumet River (INC0122_00) was based on results from site LMG020-0001 located at the upstream end of the reach. Data from this site are robust, indicating exceedance of Indiana's WQS for ammonia in 32 out of 60 samples, far exceeding the 10% rule outlined in IDEM's CALM. IDEM scientists have determined that these results are representative of the entire reach to which the data were applied (INC0122_00) based on the magnitude of the ammonia impairment, the consistency in ammonia loadings to the stream, and the distance and downstream over which the ammonia impairment can be expected to persist given the high concentrations of the pollutant at the sampling site and the flow regime of the stream along this reach.

Comment: Regarding the headwaters segment AU INC0122_00 of the EBGCR, it should be divided into two different segments as there is a distinct physical difference between the headwaters and the remaining waters which includes a stretch of 3.2 miles downstream of the monitoring station. (USSC)

Response: IDEM does split assessment units for assessment purposes when necessary. In keeping with good science and USEPA guidance regarding the delineation of representative assessment units, IDEM's decisions regarding where to split an assessment unit to achieve representativeness are based on a combination of factors including land uses and potential sources of impairment, the presence of large tributaries or diversions, and other significant influences due to changes in riparian vegetation, stream banks, substrate, slope or channel morphology. These factors were taken into consideration to determine appropriate assessment units for the Grand Calumet River in 2002. IDEM is not aware of any changes since 2002 in the factors described that would be significant enough to warrant splitting INC0122_00 into two separate assessment units.

Comment: Regarding AU INC0122_00 of the EBGCR, if IDEM chooses not to use data from other sources, the free cyanide impairment should be shifted from a Category 5 to a Category 3 because of the lack of representative data applied to the entire 3.2 mile stretch of the upper reach and the lack of data quantity from representative locations. (USSC)

Response: The representativeness of the sampling location used to assess this reach of the Grand Calumet River is addressed in IDEM's responses to the two previous questions. Regarding specifically the assessment for cyanide, IDEM has decided to make no changes to the 303(d) list with respect to cyanide listing until Indiana's Interim WQS have been formally approved by USEPA.

Comment: Regarding the GCR, the TMDL for mercury should not be delayed until dredging is complete because for other waterbodies, TMDLs are completed prior to restoration. It is difficult to locate all sources of mercury. If a TMDL was completed, it would allow for the opportunity to identify sources and help reduce the heightened levels to sustainable levels. (SDC)

Response: The water quality issues in the Grand Calumet River are very well defined and well documented. Most of these issues are attributed to the presence of contaminated sediments in these waters. Dredging to remove the contaminated sediments is scheduled to begin in 2009 for both waterbodies. It is anticipated that once completed, these dredging projects will resolve most of the impairments presently identified. Therefore, TMDL development for the multiple impairments on the Grand Calumet River waters is inappropriate and not cost-effective at this time because the dredging, once executed, is expected to result in attainment of WQS within a reasonable timeframe.

Comment: The first of IDEM's three basic steps to achieve the goal of establishing allowable loads is to determine sources of contamination, and both point and non-point sources. We know what many of the point sources are for mercury including industry, hospital, dentist offices, etc. Do we really have to wait to clean up mercury in our stream until we know every single non-point source? (SDC)

Response: It is IDEM's position that in order to effectively address an environmental problem, its source(s) must be adequately and accurately characterized. However, despite the known difficulties associated with identifying and quantifying the specific sources of mercury in the aquatic environment, IDEM has developed programs and initiatives to ensure that the information presently available regarding point and nonpoint sources of mercury is used effectively to reduce the amount of mercury entering state waters to the extent possible. For example, point source discharges of mercury into Indiana waters are regulated through IDEM's National Pollutant Discharge System (NPDES) in the Office. IDEM also has a number of voluntary programs and initiatives in place to help control nonpoint sources of mercury. IDEM's Mercury Awareness Program educates citizens on the environmental and health-related dangers associated with mercury and encourages reducing the use of mercury-containing devices and to properly dispose of mercury-containing items. IDEM also provides assistance to Healthcare facilities, dental offices and other facilities that use products containing mercury in developing and implementing a mercury pollutant minimization program plan. Information on mercury and IDEM's efforts to reduce mercury in the environment can be found online at: http://www.in.gov/idem/your_environment/mercury/index.html

TMDL Development

Comment: TMDLs for mercury and PCBs should be completed and not postponed because the USEPA has provided little guidance. The USEPA requires states to develop TMDLs or specify an alternative for all waters on the 303(d) List, mercury and PCBs are not exceptions. (AGL)(SM)

Response: IDEM has not stated that it will not develop TMDLs for mercury and PCBs in fish tissue. Rather, the agency has maintained that until adequate guidance for developing a TMDL to address these impairments is available, IDEM will continue to focus its limited resources on developing TMDLs on impairments for which appropriate methods have been established and for which best management practices have been developed to remedy them.

Comment: IDEM should follow the USEPA's rules for preparing TMDL statements. (WF)(KF)
Response: IDEM follows all rules and guidance when drafting TMDL documents. Indiana currently has 559 USEPA-approved TMDLs, and IDEM has never received a comment from USEPA regarding a failure to follow any established rule or guidance.

Comment: According to USEPA guidance, IDEM should have a comprehensive TMDL schedule for impaired waters incorporated into the 303(d) List. (AGL)
Response: *IDEM has developed an approach to the development of TMDLs that puts the agency on a pace to address impaired waters as they are added to the 303d list. The TMDL development schedule corresponds with IDEM's basin-rotation water quality monitoring schedule. To take advantage of all available resources for TMDL development, impaired waters are scheduled according to the basin-rotation schedule unless there is a significant reason to deviate from this schedule. Waterbodies could be scheduled based on the following:*

1. *Waterbodies may be given a high or low priority for TMDL development depending on the specific designated uses that are not being met, or in relation to the magnitude of the impairment.*
2. *TMDL development of waterbodies where other interested parties, such as local watershed groups, are working on alleviating the water quality problem may be delayed to give these other actions time to have a positive impact on the waterbody. If WQS still are not met, then the TMDL process will be initiated.*
3. *TMDLs that are required due to water quality impairments relating to pollutant parameters where no USEPA guidance is available, may be delayed to give USEPA time to develop guidance.*

Comment: Indiana's proposed 2 (two) year TMDL schedule should be made available for public comment. (AGL)
Response: Per USEPA requirements, the two-year TMDL schedule, along with a strategy for addressing TMDL development in the long term, will be included in IDEM's finalized 303(d) list submission to USEPA on April 1, which will be made available on IDEM's website once approved.

Comment: IDEM's TMDL process should have clear deadlines and public transparency. (AGL)
Response: IDEM's TMDL development process is completely open to the public. IDEM has been cited nationally as having one of the most comprehensive and open processes, as compared to other states. All TMDLs written by IDEM have at least two or more mandatory public meetings, located in the watershed in which the TMDL will focus. The first meeting presents general information to the public and provides opportunity for public comment and information submittal. Indiana is one of a small percentage of states that actively encourages the submittal of third party data and uses this data in the development of TMDLs. IDEM's second public meeting focuses on the presentation of the draft TMDL and again IDEM solicits public comment. IDEM posts all meetings and documents on the agency website and we actively mail hundreds of stakeholders each year with meeting announcements and requests for information. Deadlines for TMDLs are flexible to allow for the inclusion of data, adequate public comment, and needed scientific analysis.

Further Clarifications within the 303(d) List

Comment: The 2008 303(d) List should be referenced on the front page of IDEM's website. (KF)

Response: In addition to being published in the Indiana Register online, IDEM's Notice of Public Comment Period for the 2008 draft 303(d) list was posted on several IDEM Office of Water Quality websites, including those for the TMDL and Watershed Planning programs, the Integrated Report website, and the 303(d) list site. Notice of the IDEM's extension of the public comment period for the draft 303(d) list was also posted on the 303(d) website and appeared as Agency news on IDEM's website: http://www.in.gov/idem/.

Comment: Geographical Information Systems (GIS) map links having the stream segments labeled with AU Identifications (IDs) should be provided. (SDC)

Response: IDEM agrees with the need for greater accessibility of geographic information related to 303(d) listings and is currently preparing an interactive application in-house that will provide this information via the Internet. This information is expected to be updated on the Indiana Water Quality Atlas (IWQA), which currently provides the information for previous 303(d) lists. The IWQA is available online at: http://iwqa.idem.in.gov/.

Comment: An additional consolidated spreadsheet exhibiting the 2008 303(d) circumstances on a watershed-by-watershed basis would be helpful if added to the list. (SM)

Response: Indiana's draft 303(d) List included the 14-digit hydrologic unit code (HUC) for each impairment listed. In addition to a Microsoft Word document containing the 303(d) list, IDEM made a Microsoft Excel spreadsheet version of all tables contained in the draft list available online shortly after publication of the Draft list to facilitate sorting and searching by watershed at:

http://www.in.gov/idem/programs/water/303d/index.html

These tables appear under the link entitled, "Notice of Public comment Period: Excerpted Tables[XLS]"

Comment: A comprehensive and complete reference list of all data resources, as well as a compilation of the databases used to conduct the 2008 303(d) assessment, and an explanation of inclusions and exclusions should be provided. (USSC) (SDC)

Response: In past listing cycles, this information has been included with the State's Integrated Report, which includes the 303(d) List of Impaired Waters. In addition to describing the Agency data used to develop the 2008 303(d) list, the 2008 Integrated Report contains a detailed discussion of IDEM's data solicitation, review and use of data from outside sources. Although IDEM makes this information available through the Integrated Report, IDEM agrees that it would be more useful to the public if included in the Notice of Comment Period for the draft 303(d) List. Given this, it is IDEM's intention to incorporate this information into the Notice of Comment Period for the 2010 Draft 303(d) list.

Initial EPA Comments Submitted to IDEM on 12/05/07:

1. With regard to the section "Changes in Segmentation and their Effect on Indiana's 303(d) list", I have the following questions:
   a. Since Table 1 includes waterbody segments from the entire Integrated Report (IR), not only Category 5, that have been resegmented, please provide the following information:
      - Category to which the retired and resegmented Assessment Units (AUs) belong to.
      - Newly created AUs IDs in which the previously original AUs were split into.
      - Category to which the newly created AUs belong to.

      IDEM Response: Retiring an AU means that the AUID will no longer be used for tracking purposes. The original AU no longer exists because it has been split into two or more smaller AUs. Therefore, it cannot be assigned to any category. The original AU is replaced in IDEM's ADB with the resulting, smaller AUs. These AUs are then placed into one/more categories of the State's Consolidated list depending on the results of the reassessment that is completed whenever an AU is split. This information has been incorporated into Indiana's consolidated List, which is submitted as part of the 2008 Integrated Report (Appendix B).

2. With regard to the section "Waterbody Impairments Proposed to Be Removed from Category 5A as a Result of TMDL Development", I have the following questions:
   a. Table 2 includes waterbody segments / impairments proposed to be moved from Category 5 to Category 4A based on TMDL completion.
      - As clearly mention in the narrative, some of these waterbody segments / impairments included in this table (waters in TMDLs I, K, N and O) are pending for Category 4A move approval based on Final TMDL approval before the April 1, 2008 List deadline. In addition to this, the table below shows three waterbody segments / impairments included in Table 2 that were not found to be included in the TMDL approval. Please clarify.

BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT	TMDL
UPPER WABASH	05120101050050	JAY CO	INB0155_T1013	EAST PRONG (HEADWATER)-UNNAMED TRIBUTARY	IMPAIRED BIOTIC COMMUNITIES	L
UPPER WABASH	05120101050060	JAY CO	INB0156_T1001	LIMBERLOST CREEK-UNNAMED TRIBUTARY	IMPAIRED BIOTIC COMMUNITIES	L
UPPER WABASH	05120101050060	JAY CO	INB0156_T1006	OAKLEY DITCH	IMPAIRED BIOTIC COMMUNITIES	L

IDEM Response: These AUs are indexed at high resolution after the TMDL for impaired biotic communities in the Limberlost Watershed was completed. IDEM has submitted a letter to USEPA Region V requesting that the TMDLs for these waters be approved based on the information contained in the Limberlost TMDL, which is applicable to these impairments. These impairments have been added back to Category 5A pending their approval of as part of the Limberlost TMDL.

- Waterbody segments / impairments mention in the table above and the segments in TMDLs I, K, N and O are subject to remain in Category 5A if requirements for Category 4A move are not met.

IDEM Response: Since the draft list was published, IDEM has received U.S. EPA approval for the Flatrock-Haw Creek TMDL (O). IDEM has not yet received formal approval for the other West Fork Whitewater River TMDL (I), the TMDL for Duck, Pipe, Killbuck and Stony Creeks (K), or the Busseron Creek TMDL (N) and has added these impairments back to Category 5A of Indiana's 303(d) List of Impaired Waters.

.

- The following waterbody segment / impairment has been double entered in Table 2. Please correct.

BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT	TMDL
UPPER WABASH	05120101040010	JAY CO	INB0141_T1023	WABASH RIVER	E. COLI	G

IDEM Response: This error has been corrected in IDEM's finalized 303(d) list submission.

b. Table 3 includes waterbody segments / impairments proposed to be moved from Category 2 or 3 to Category 4A based on TMDL completion.

- The table below shows waterbody segments / impairments included in Table 3 that were previously listed in Category 5 and therefore should have been included in Table 2. Please clarify.

BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT	TMDL

LOWER WABASH	05120111160110	SULLIVAN CO	INB11GB_T1037	BUSSERON CREEK - PAXTON	TOTAL DISSOLVED SOLIDS	N
LOWER WABASH	05120111160130	SULLIVAN CO	INB11GD_00	BUSSERON CREEK-TANYARD BRANCH	TOTAL DISSOLVED SOLIDS	N

IDEM Response: IDEM concurs that all of the impairments shown in the table above were in Category 5A of Indiana's 2006 303(d) list. They were placed in Table 3 of IDEM's Notice of Comment Period for the draft 2008 303(d) list in error. With the exception of those assessment units (AUs) keyed to the Busseron Creek TMDL (N), all of these previously listed impairments were moved to Appendix A, Table A2 of IDEM's finalized 2008 303(d) list submission packet. Because the TMDL for Busseron Creek (N) was not approved at the time of Indiana's 2008 303(d) List was submitted to USEPA, these AUs were moved to Appendix A, Table A13 (Category 5A) of IDEM's finalized 2008 303(d) list submission packet.

- In addition, the table below shows waterbody segments / impairments included in Table 3 that were previously listed in Category 4A because there were addressed in a previously approved TMDL dated 7/21/05. These waterbody segments / impairments should not be included in Table 3. Please clarify.

BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT	TMDL
WEST FORK WHITE	05120202020030	OWEN CO	INW0223_T1018	MCCORMICKS CREEK	E. COLI	J
WEST FORK WHITE	05120202020050	OWEN CO	INW0225_00	RATTLESNAKE CREEK	E. COLI	J

WEST FORK WHITE	05120202020070	OWEN CO	INW0227_00	RACCOON CREEK-LITTLE RACCOON CREEK	E. COLI	J
WEST FORK WHITE	05120202020080	OWEN CO	INW0228_00	RACCOON CREEK-LICK CREEK	E. COLI	J

IDEM Response: IDEM concurs that all of the impairments shown in the table above were in Category 4A of Indiana's 2006 Consolidated List. These Impairments were incorrectly associated with the TMDL for West Fork White River Owen County Tributary Watershed in Table 3 of IDEM's Notice of Comment Period for the draft 2008 303(d). Having been addressed in the TMDL for the Middle West Fork White River in 2005, they were already in Category 4A. Therefore, they have been removed from Table 3 and now appear in Appendix B of IDEM's finalized 2008 303(d) list submission packet, which identifies all Category 4A impairments approved by USEPA as of April 1, 2008.

3. With regard to the section "Waterbody Impairments Proposed to Be Removed from Category 5A on the Basis of IDEM's Rotating Basin Monitoring and Assessment Strategy", I have the following question:

a. Please provide the category to which the waterbody segments / impairments mention in Table 4 are moving to.

IDEM Response: This information has been incorporated into Indiana's consolidated List, which is submitted as part of the 2008 Integrated Report (Appendix B).

4. With regard to the section "Waterbody Impairments Proposed to Be Removed from Category 5A due to Resegmentation", I have the following questions:

a. Table 5 includes waterbody segments / impairments proposed to be moved from Category 5 based on segmentation changes. Resegmentation on its own can't be use a legitimate delisting reason. As clearly stated in the narrative, the original assessments for AUs that were split were also reevaluated. The resulting reassessments were applied to the newly created AUs and when appropriate some were added back to the list in Table 9 associated with new AU IDs. Given this fact, please provide the following info:

- Newly created AUs IDs in which the previously original AUs were split into.

IDEM Response: This information has been incorporated into Appendix A, Table A1 of IDEM's finalized 2008 303(d) list submission packet.

- Category to which the newly created AUs belong to.

IDEM Response: This information has been incorporated into Indiana's consolidated List, which is submitted as part of the 2008 Integrated Report (Appendix B). If the newly created AUs are not moving into Category 5, provide true delisting reasons based on the resulting reevaluations.

IDEM Response: IDEM has clarified the information that now appears in Appendix A, Table A5 by removing the delisting explanations. No impairments were removed from the 303(d) list purely as a result of segmentation changes. Rather, all impairments on AUs that were split for assessment purposes were reevaluated and applied as appropriate to the resulting new AUs. These changes can be tracked using the tables provided in Appendix A:

- *Table A1 is the primary table for tracking. This table shows all impairments on waters split for assessment purposes and the new AU to which the previous impairment applies.*
- *Table A5 shows the same impairments in Table A1 as delistings associated with resegmentation.*
- *Table A9 shows the previously listed impairments from Table A5 applied to one/more of the new AUs.*

5. With regard to the section "Waterbody Impairments Proposed to Be Removed from Category 5A on the Basis of Information Received Since the 2006 303(d) List Was Developed", I have the following questions:

a. Table 6 includes waterbody segments / impairments proposed to be moved from Category 5 to Category 2 or 3 based on information received since the 2006 303(d) List was developed. Please provide specifically to which of the two Categories (2 or 3) these waterbody segments / impairments are moving to.

IDEM Response: Indiana's Consolidated List shows all categories for each waterbody tracked in IDEM's ADB. Please refer to IDEM's 2008 Integrated Report, Appendix B for the category or categories to which these waters belong.

b. According to the delisting explanations given in Table 6, it seems that most of these waters with the exception of the waters listed below should be considered as moving to Category 2.

IDEM Response: Indiana's Consolidated List shows all categories for each waterbody tracked in IDEM's ADB. Please refer to IDEM's 2008 Integrated Report, Appendix B for the category or categories to which these waters belong.

c. The following waterbody segments / impairments in Table 6 should be considered as moving to Category 3.

BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT
UPPER WABASH	5120107010040	TIPTON CO	INB0714_T1001	ROSS DITCH	IMPAIRED BIOTIC COMMUNITIES
UPPER WABASH	5120107010040	TIPTON CO	INB0714_T1002	NORTH CREEK	IMPAIRED BIOTIC COMMUNITIES
UPPER WABASH	5120107010040	TIPTON CO	INB0714_T1003	OFF DITCH	IMPAIRED BIOTIC COMMUNITIES

IDEM Response: Indiana's Consolidated List shows all categories for each waterbody tracked in IDEM's ADB. Please refer to IDEM's 2008 Integrated Report, Appendix B for the category or categories to which these waters belong.

d. According to the delisting explanation given in Table 6, it seems that the following waterbody segment / impairment listing was a result of segmentation and AU ID confusion, and therefore not considered for a true Category move. As stated in the delisting explanation this is not a true segment but an artifact, and for tracking purposes its AU ID should be retire. Since it looks like this segment / impairment is tied to AU ID INB06P1033_00. Why doesn't segment INB06P1033_00 appear listed for E. coli in Table 17?

MAJOR BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT	EXPLANATION
UPPER WABASH	5120106100030	WHITE CO	INB06A3_P1031	LAKE SHAFER	E. COLI	Segment is an artificial path. Added back to 303(d) list as Assessment Unit ID INB06P1033_00

IDEM Response: This impairment now appears correctly in Table A13 as a Category 5A impairment.

e. The following waterbody segment was not found to be previously listed for TDS impairment under Category 5. Please clarify.

BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT
UPPER ILLINOIS	07120001140010	LAKE CO	INK01E1_T1108	BULL RUN BASIN	TOTAL DISSOLVED SOLIDS

IDEM Response: This waterbody was added to Table 6 in IDEM's Notice of Public Comment Period for the draft 2008 303(d) list in error. IDEM's Assessment Database does not show this waterbody as impaired for TDS, which is why it was not previously listed. This error has been corrected in the listing tables provided in Appendix A of Indiana's finalized submission packet.

f. The following waterbody segment / impairment has been double entered in Table 6. Please correct.

BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT
OHIO TRIBUTARIES	5140202040100	VANDERBURGH CO	INE024A_T1003	PIGEON CREEK-KLEYMEYER PARK	SULFATES

IDEM Response: This duplication has been corrected. This impairment now appears in Appendix A, Table A13 of Indiana's finalized 303(d) list submission packet.

6. With regard to the section "Waterbody Impairments Proposed to Be Removed from Category 5A on the Basis of change in IDEM's assessment criteria for biological data", I have the following question:

a. Please provide specifically to which of the two Categories (2 or 3) the waterbody segments / impairments mention in Table 7 are moving to. According to the delisting explanations given in Table 7, it seems that all of these waters should be considered as moving to Category 2.

IDEM Response: Indiana's Consolidated List shows all categories for each waterbody tracked in IDEM's ADB. Please refer to IDEM's 2008 Integrated Report, Appendix B for the category or categories to which these waters belong.

7. With regard to the section "Waterbody Impairments Proposed to Be Removed from Category 5B on the Basis of change in IDEM's assessment criteria for fish consumption", I have the following questions:

a. Please provide to which category the waterbody segments / impairments mention in Table 8 are moving to. Included below is a breakdown of the suggested "move to" categories according to the delisting explanations given for Table 8:

DELISTING REASON KEY	SUGGESTED "MOVE TO" CATEGORY
1) were found to fully supporting of fish consumption in accordance with the revised methodology	CATEGORY 2
2) have insufficient information to support an assessment of impairment	CATEGORY 3
3) the data used in the original assessment was collected on a different waterbody	CATEGORY 3

IDEM Response: Indiana's Consolidated List shows all categories for each waterbody tracked in IDEM's ADB. Please refer to IDEM's 2008 Integrated Report, Appendix B for the category or categories to which these waters belong.

b. What does insufficient data (delisting reason key 2) stands for? Is this solely related to having at least one sample concentration value above the detection limit? Or are there any other considerations such as the amount of samples required and/or the availability of data that is 5 years old or less? Please clarify.

IDEM Response: "Insufficient data" specifically means that while IDEM has some fish tissue data for the waterbody in question, the concentration value(s) was less than the analytical method detection limit. No other meaning should be inferred.

c. Is delisting reason key 3 in Table 8 related to the fact that the original assessments for listing these FCA-based impairments were based on probabilistic data sampling? Does this means that the new FC methodology requires FCA listing assessments to be based solely on site specific data?

IDEM Response: The delisting reasons are not related to the sampling approach used to collect the data (e.g. probabilistic, targeted, etc.). Rather, they are based in part on the differences in how results from a given site are applied. Prior to developing this method, IDEM relied on the fish consumption advisories to makeassessments for fishable use. The geographical extent over which results from a given site are applied for the purposes of developing a public health advisory tends to be much broader than what is appropriate for the purposes of identifying impairment for CWA purposes. As a result, previous impairments based on the FCA were often based on broad extrapolations rather than site-specific data. When fish tissue data are applied within the context of the CWA, extrapolations are based on a different set of decision rules aimed at identifying specifically where impairment exists. For the purposes of making CWA assessments, fish tissue

data are applied to the stream or stream reach upon which they were collected and will extrapolate over generally smaller distances than the FCA does for the purposes of issuing a public health advisory.

8. With regard to the section "Waterbody Impairments Proposed to Be Added to Category 5A on the Basis of new assessments", I have the following question:

- The following waterbody segment / impairment was included in Table 9 but was not included in Table 17. Please clarify/correct.

MAJOR BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT	KEY
UPPER ILLINOIS	07120001140010	LAKE CO	INK01E1_T1108	BULL RUN BASIN	TOTAL DISSOLVED SOLIDS	1

IDEM Response: IDEM's response to comment 5e applies.

9. With regard to the section "Waterbody Impairments Proposed to Be Added to Category 5A on the Basis of information received since the 2006 303(d) list was developed", I have the following question:

- The following waterbody segment / impairment was included in Table 10 but was not included in Table 17. Please clarify/correct.

MAJOR BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT
UPPER WABASH	05120106120110	WHITE CO	INB06P1033_00	LAKE SHAFER	E. COLI

IDEM Response: This impairment now appears as a Category 5A impairment in Appendix A, Table A13 of Indiana's finalized 303(d) list submission packet.

10. With regard to the section "Waterbody Impairments Proposed to Be Added to Category 5A based on IDEM's new assessment methodology for recreational use of lakes (aesthetics)", I have the following question:

a. The following waterbody segment / impairment has been double entered in Table 11. Please correct.

BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT
UPPER WABASH	05120106050050	FULTON CO	INB06P1086_00	SOUTH MUD LAKE	PHOSPHORUS

IDEM Response: The duplication of this impairment, which appears in Appendix A, Tables A11 and A13 of Indiana's finalized 303(d) list submission packet.

11. With regard to the section "Waterbody Impairments Proposed to Be Added to Category 5B based on IDEM's new assessment methodology for fish consumption", I have the following questions:

a. Table 12 includes waterbody segments / impairments proposed to be added to Category 5B based on the new assessment methodology for fish consumption.

- The following waterbody segment / impairment was previously listed under Category 5 for FCA-mercury impairment. This is only a change in terminology that doesn't count as a new listing. Please correct.

BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT
GREAT LAKES	04050001170030	LAGRANGE CO	INJ01P1026_00	OLIN LAKE	MERCURY IN FISH TISSUE

IDEM Response: This has been corrected in Appendix A, Table A12 of Indiana's finalized 303(d) list submission packet.

- The following waterbody segments / impairments were resegmented and split into new AU IDs, but they still appear listed under the original old AU ID in Table 12 and Table 18. Please clarify/correct

BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT
UPPER ILLINOIS	07120001020050	ST JOSEPH CO	INK0125_00	POTATO CREEK-KARTOFFEL CREEK	PCBS IN FISH TISSUE
UPPER ILLINOIS	07120001060100	STARKE CO	INK016A_00	YELLOW RIVER-KNOX	PCBS IN FISH TISSUE
UPPER ILLINOIS	07120002020060	JASPER CO	INK0226_T1004	IROQUOIS RIVER	MERCURY IN FISH TISSUE
UPPER ILLINOIS	07120002070020	BENTON CO	INK0272_00	SUGAR CREEK-EARL PARK	PCBS IN FISH TISSUE

IDEM Response: IDEM has verified that all of these impairments have been properly applied to the resulting AUs and are listed in Appendix A, Table A14 of Indiana's finalized submission packet as Category 5B impairments.

12. 40 CFR section 130.7(b)(5) requires that "Each State shall assemble and evaluate all existing and readily available water quality related data and information to develop the list." As part of this requirement, States should be soliciting data and information not only from internal but also from outside sources.

a. Given this, what does IDEMs solicitation process encompass?

- Does IDEM solicit data from outside sources through a separate notice published in the *State Register* and/or through sending formal solicitation letters to individual stakeholders and other interested parties? Or does it rely mainly on the list public notice itself?

IDEM Response: IDEM's most recent solicitation is described in detail in the State's 2008 Integrated Report. In 2007, IDEM conducted a broad solicitation by email or letter to approximately 670 individual organizations that fall into one or more of the following categories:

- *Relevant programs at every college and university in the state*
- *Environmental groups and interested citizens identified through various sources*
- *Hoosier Riverwatch (via coordinator), Indiana's statewide volunteer monitoring program*
- *Drinking water utilities*
- *County Health Departments and the Indiana State Department of Health*
- *County Soil and Water Conservation Districts (via Indiana Association of Soil and Water Conservation Districts)*
- *MS4 entities and CSO communities*
- *Federal agencies (USGS, USFS, etc.)*
- *State professional organizations (Indiana Water Resources Assn., Indiana Association of Cities and Towns, etc.)*

The solicitation was also published on several agency websites to reach the largest audience possible.

- What is the data cut-off date?

IDEM Response: The cut-off date for this solicitation was March 31, 2007.

- Do the data, obtained through the list public notice, get incorporated into the current listing cycle, or do it get utilize for the listing assessments of the next listing cycle?

IDEM Response: The 2007 solicitation was intended to serve two purposes. IDEM is presently developing a framework for the solicitation, review, and potential use of external data in some OWQ decision making processes, including 305(b) assessments and 303(d) listing decisions. This work is expected to be completed prior to the 2010 cycle. However, it was determined that a broad data solicitation prior to having the external data framework fully developed would provide a fuller understanding of the variety of organizations that are collecting water quality data in Indiana, the

types of data they are collecting and its relative data quality. It was originally IDEM's intent to review and incorporate any usable data received into assessments for the 2008 cycle. In response to this solicitation, IDEM received more than 100 water quality data packages and reports from 41 individual organizations. However, the amount of data received in response to this solicitation overwhelmed the staff resources available to review it in such a short timeframe. IDEM has completed its review of the biological data sets submitted and has determined that two are usable for 305(b)/303(d) decisions. We are presently in the process of reviewing the chemical data sets. All data from this solicitation that are determined to be usable for assessment purposes will be incorporated into the 2010 cycle.

- Are there any other outside source data considerations, besides the fact that the data must meet IDEM's quality assurance and quality control (QAQC) requirements as outlined in IDEM's surface water quality monitoring Quality Assurance Project Plan (QAPP)?

IDEM Response: Data must also be readily available, which is currently defined by IDEM as requiring little more than the necessary QAQC review to incorporate it into assessments. In other words, if the data set requires significant staff resources to get it into a format that is necessary for mapping the data and making assessments, it would not be considered by IDEM to be readily available. Having said this, IDEM recognizes that if we are to take full advantage of the wide variety of data that external organizations have demonstrated an interest in providing the Agency, we must in turn, make our requirements for submission (i.e. formatting, minimum information requirements, etc.) clear and easy to follow. This is one of the primary objectives of IDEM's external data framework project currently underway.

b. What data sources outside IDEM, if any, were used in this cycle listing assessments?

IDEM Response: As in previous cycles, IDEM has solicited cooperative agreements with the USGS to collect water quality data at the same sites sampled by IDEM which is used in 305(b) assessments and 303(d) listing decisions. IDEM also routinely uses data collected by the Clean Lakes Program through a contractual agreement with Indiana University School of Public and Environmental Affairs (SPEA) for its CWA 314 assessments. In 2008, IDEM used Clean Lakes Program data to make assessments using IDEM's new methodology for determining designated use support of Indiana lakes. The data used in these assessments were collected by both Clean Lakes program staff and trained volunteers and analyzed in the SPEA labs.

Additional EPA Comments to IDEM's Draft 303d list for the 2008 cycle Submitted to IDEM on 12/05/07:

1. Please clarify what defines sufficient data according to each listing parameter. Include information on minimal sample size required to assess a waterbody. Is the minimum sample requirement of three data points (Table 19 of draft list) apply to all assessments? If so, explain why Indiana established this minimum requirement of three data points to assess a waterbody.

IDEM Response: The minimum sample requirement does not apply to all assessments. The table below summarizes minimum requirements for the data and information IDEM uses to make assessments.

Parameter Type	*Minimum Information Required for Assessment*
Aquatic Life Use Support – Rivers and Streams	
Toxicants	*Minimum of three (3) measurements*
Conventional Inorganics	*Minimum of three (3) measurements*
Nutrient Parameters	*Minimum of three (3) measurements and two or more of parameters must have been exceeded on same date in order to classify a waterbody as impaired.*
Benthic aquatic macroinvertebrate Index of Biotic Integrity (mIBI)	*Minimum of one (1) measurement, preferably with corresponding qualitative habitat use evaluation (QHEI) score**
Fish community (IBI)	*Minimum of one (1) measurement, preferably with corresponding qualitative habitat use evaluation (QHEI) score**
**The Qualitative Habitat Evaluation Index (QHEI) is not required to determine aquatic life use support but is used, when available in conjunction with mIBI and/or IBI data to evaluate the role that habitat plays in waterbodies where impaired biotic communities (IBC) have been identified.*	
Aquatic Life Use Support – Lakes and Reservoirs	
Surveys of the status of sport fish communities in lakes	*No minimum sample requirement; Assessments are revised with most recent plans published by IDNR.*
Trout Stocking Plans	*No minimum sample requirement; Assessments are revised with most recent plans published by IDNR.*
IDNR information on pH levels in lakes and reservoirs	*No minimum sample requirement; Assessments based on narrative reports and communication from IDNR staff.*
Temperature	*No minimum sample requirement; Assessments for lake temperatures are not a regular part of IDEM's assessment process. All data are reviewed when readily available and adequacy of the data set as a whole is determined on a case-by-case basis.*
Fishable Use Support (Human Health)	
Mercury and PCBs in Fish Tissue	*One actual concentration value (including estimated values above the method detection limits)*
Recreational Use Support (Human Health) – All waters	
Bacteria (E. coli)	*Minimum of ten (10) grab samples or one (1) geometric mean result calculated from five (5) equally spaced samples over thirty (30) days.*
Drinking Water Use Support – Rivers	
Toxicants	*Minimum of three (3) measurements*
Conventional Inorganics	*Minimum of three (3) measurements*

Parameter Type	Minimum Information Required for Assessment
Taste and odor producing substances	*No minimum sample requirement; Weight of evidence approach is used; typically requires numerous public complaints regarding taste and odor such that water utility must employ additional treatment to remedy the problem.*
Recreational Use Support (Aesthetics) – Lakes and Reservoirs	
Natural Lakes and Reservoirs	*Minimum of three (3) total phosphorus results with corresponding Chlorophyll a results collected over three years (consecutive or nonconsecutive).*
Drinking Water Use Support – Lakes and Reservoirs	
Applications for permits to apply algaecides	*One permit application*

2. Please include additional details on the biological thresholds used by Indiana in making attainment decisions. First, information on what the range of scores are for each fish IBI and mIBI category should be included (e.g range for excellent including the highest possible score, good, fair, poor, very poor). It is hard to put the cuts-off in context without the full range. Second, IDEM should describe how the thresholds were determined between supporting and not supporting. For example, why are the slightly impaired mIBI scores considered supporting rather than not supporting? This information should help EPA determine how far from reference the cut off point between supporting and not supporting is placed.

IDEM Response: Please see the table below for the requested information.

Biotic Index Score and Associated Assessment Decision	Integrity Class	Corresponding Integrity Class Score	Attributes
Macroinvertebrate data collected with artificial samplers			
mIBI ≥1.8 (artificial substrate sampler) indicates full support	*Excellent*	*6.0-8.0*	*NA*
	Good	*4.0-5.9*	*NA*
	Fair	*1.8-3.9*	*NA*
mIBI <1.8 (artificial substrate sampler) indicates impairment	*Poor*	*1.0-1.7*	*NA*
	Very Poor	*0-0.9*	*NA*
Macroinvertebrate data collected using KICK methods			
mIBI ≥2.2 (kick methods) indicates full support	*Excellent*	*6.0-8.0*	*NA*
	Good	*4.0-5.9*	*NA*
	Fair	*2.2-3.9*	*NA*
mIBI <2.2 (kick methods) indicates impairment	*Poor*	*1.0-2.1*	*NA*
	Very Poor	*0-0.9*	*NA*
Fish community data			
IBI ≥36 indicates full support	*Excellent*	*53-60*	Comparable to "least impacted" conditions, exceptional assemblage of species.
	Good	*45-52*	Decreased species richness (intolerant species in particular), sensitive species present.
	Fair	*36-44*	Intolerant and sensitive species absent, skewed trophic structure.

Biotic Index Score and Associated Assessment Decision	*Integrity Class*	*Corresponding Integrity Class Score*	*Attributes*
IBI <36 indicates impairment	*Poor*	*23-35*	Top carnivores and many expected species absent or rare, omnivores and tolerant species dominant.
	Very Poor	*12-22*	Few species and individuals present, tolerant species dominant, diseased fish frequent.
	No Fish	*<12*	No fish captured during sampling.

3. How does Indiana determine when temperatures in lakes are causing an adverse effect on aquatic life? How does this relate to the portion of IDEM's Water Quality Standards that state "The maximum temperature rise at any time or place above natural temperatures shall not exceed five (5) degrees Fahrenheit (two and eight-tenths (2.8) degrees Celsius) in streams and three (3) degrees Fahrenheit (one and seventenths (1.7) degrees Celsius) in lakes and reservoirs."

IDEM Response: IDEM's assessments of temperature in lakes are very limited in scope and are not a regular part of IDEM's assessment process. IDEM's past assessments for thermal impacts to lakes were based on temperature data submitted by permitted facilities as part of their permit requirements. These data were reviewed by IDEM biologists, and it was determined that, in some cases, the facility's discharge was having an adverse impact on aquatic life in the receiving water. These impairments appear in Category 4B of Indiana's Consolidated Listing and are discussed in greater detail in Appendix D of Indiana's finalized 2008 303(d) list submission materials.

4. In reviewing the nutrient thresholds proposed in the methodology, EPA understands that currently Indiana does not have numeric criteria to use in making these assessments but is actively developing them. We are pleased that IDEM continues to incorporate nutrient data for use in making assessments. EPA also understands that once completed, the nutrient criteria may differ from the values used for this report. We look forward to IDEM's adoption of nutrient criteria and implementing them for the 2010 IR report.

IDEM Response: IDEM is actively working on nutrient criteria development and will incorporate those criteria into its assessment processes when codified in the State's WQS and approved by U.S. EPA. Until that time, IDEM will continue to use the benchmark criteria stated in its Consolidated Assessment and Listing Methodology.

5. The following is just a reminder: As requested in the Integrated Report (IR) Guidance, listing information submitted via the assessment database (ADB) or compatible data management system should correspond and be consistent with Category 5 and other categories submitted to EPA Region 5 as final.

IDEM Response: IDEM recently upgraded its ADB to a more recent version that better accommodates US EPA's Integrated Reporting Format. However, the structure of the new ADB is very different than the structure of the ADB IDEM has used in previous cycles, requiring a significant amount of review to ensure that all assessment data were properly migrated. Although database maintenance is an ongoing task, it is anticipated that the review and corrections needed specifically as a result of IDEM's data migration and those needed to

ensure consistency between the information in the ADB and that which is submitted to U.S. EPA as Indiana's finalized 303(d) list, will be complete by the 2010 cycle.

6. The numbers provided in the Tables under the "Summery of Changes Section" (Table 13 -16), may be subject to change pending upon final list submittal. For example, the numbers of Aus and impairments proposed for Category 4A might change pending on the TMDL completion status.

IDEM Response: These numbers have been adjusted according to current TMDL approval status.

7. Please fix the following errors:
   a. 1st paragraph of "Waterbody impairments proposed to be added to Category 5A based in IDEM's new assessment methodology for recreational use of lakes" Section states the following: "In 2007, IDEM developed additional assessment criteria for recreational use support status, specifically [within] the context of aesthetics, of Indiana's natural lakes and reservoirs. . . ." Changed "withing" to "within".

   IDEM Response: This has been corrected.

   b. Eliminate double entries for records in the following Tables:
      - Table 2

BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT	TMDL
UPPER WABASH	05120101040010	JAY CO	INB0141_T1023	WABASH RIVER	E. COLI	G

      - Table 6

MAJOR BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT	EXPLANATION
OHIO TRIBUTARIES	5140202040100	VANDERBURGH CO	INE024A_T1003	PIGEON CREEK-KLEYMEYER PARK	SULFATES	Data indicates full support per Indiana's revised WQS

      - Table 11

MAJOR BASIN	14-DIGIT HUC	COUNTY	ASSESSMENT UNIT ID	ASSESSMENT UNIT NAME	CAUSE OF IMPAIRMENT
UPPER WABASH	05120106050050	FULTON CO	INB06P1086_00	South Mud Lake	PHOSPHORUS

   IDEM Response: These errors have been corrected.

   c. Fix the number of the Tables referenced in the following methodology subsections:
      - "Relationship of IDEM's WQS-Based Criteria to the FCA"
        - ✓ 1rst sentence in the paragraph below Table 26 states the following: "Table 21 illustrates that the levels of fish tissue contaminants that trigger a FCA have little relation to the levels of fish tissue contaminants on which the WQS criteria are based." Table 21 should be change to Table 26.

   IDEM Response: This has been corrected in Appendix B.

      - "Step 3: Apply WQS-based concentration thresholds to determine use support" for FCA
        - ✓ The following is stated: "The WQS-based assessment thresholds shown in Table 21 were applied to all lakes and streams for which sufficient fish tissue data were available. IDEM's methods for applying these criteria are summarized in Table 23." Table 21 should change to Table 25, and Table 23 should change to Table 28.

   IDEM Response: This has been corrected in Appendix B.

- "How to interpret impairments for fish consumption identified on Indiana's 303(d) List of Impaired Waters"
  - ✓ 3rd paragraph under this subsection states the following: "At present, adequate translators do not exist for applying concentrations of mercury or PCBs in fish tissue to concentrations in the water column. Toxicants may be present in fish at levels that have no ill effects on aquatic life but due to bioaccumulation may make them unsafe to eat. The concentrations shown in Table 21 apply only to fish tissue, not water." Table 21 should change to Table 28.

IDEM Response: This has been corrected in Appendix B.

- "Consolidated Listing Methodology"
  - ✓ Last sentence in the 2nd paragraph under this subsection states the following: ". . . All waterbody AU identified as "Not Supporting" in accordance with the criteria described in Table 18 were considered for 303(d) listing purposes." Table 18 should change to Table 19.

IDEM Response: This has been corrected in Appendix B.

OHIO RIVER TRIBUTARIES	05090203 05140101 05140104 05140201 05140202	3825	Aquatic Life Use	2007	Biological Chemical	24% 76%	76% 24%	95% 90%	22% 19%

[1]Target population = 8 digit HUC

For this report, results were updated to show comprehensive Basin Aquatic Life Use assessments which incorporate chemical results as well as fish and macroinvertebrate community data.

Calculations: %Attainment = Assessment of Biology (IBI>35, mIBI>2.2,HD>1.4) and No Chemical Parameter Violations; %Non-Attainment = Assessment of Biology (IBI<35, or mIBI<2.2, or HD<1.4) and/or Chemical Parameter Violations. Any violations of Biological or Chemical parameters resulted in Non-Attainment.

%Attainment and %Non-Attainment values are calculated by IDEM staff using commands provided by USEPA National Health and Environmental Effects Research Laboratory, Corvallis, Oregon (www.epa.gov/nheerl/arm/analysispages/techinfoanalysis.htm) as well as the R Development Core Team (2005). Appendix G CWA314Lakes 2008.xls		Trophic status and trends of Indiana’s Lakes

Geospatial Files and Notes:

The IN305B in the ADB and the Entity_ID in the Indiana Reach Index 2008 are the same, providing for GIS table joins and links. The following geospatial files accompany Indiana's 2008 submission. The Ohio River and Lake Michigan are not included in these files.

GEOSPATIAL FILE	FILE CONTENTS
IN_RI2008_Lakes.shp	Shapefile for all lakes in IDEM's Assessment database
IN_RI2008_Streams.shp	Shapefile for all streams in IDEM's Assessment database
IN_Cat4A_2008.shp	Shapefile for all TMDLs completed as of April 1, 2008 (Category 4A)
IN_303d08_Lakes.shp	Shapefile for 303(d)-listed lakes (Category 5)
IN_303d08_Streams.shp	Shapefile for 303(d)-listed streams (Category 5)

User Flags in the Database:

Partial: is a relict transferred from the ADBv1, this flag will be eliminated through QA/QC.

Not Attainable: applies to aquatic life use assessments on limited use waters.

IIFA – PCB: used to indicate where data are available but insufficient for assessment. Used only for fish tissue data.

IIFA – Hg: used to indicate where data are available but insufficient for assessment. Used only for fish tissue data.

Aesthetics: used to distinguish recreational use for aesthetics (chlorophyll a, phosphorus, etc) versus recreational use for human health (*E. coli*).

The following table defines the codes used in the Assessment Database to describe causes of water quality impairments:

ADBv2 CAUSE ID*	ADBv2 CAUSE NAME	IDEM CAUSE (CAUSE CODE in ADBv1)	IDEM CAUSE NAME (CAUSENAME in ADBv1)	IDEM CAUSE DEFINITION
96	Arsenic	510	Arsenic	More than one result in three-year period exceeds chronic aquatic criterion (CAC) defined in Indiana's water quality standards
105	Benthic-Macroinvertebrate Bioassessments (Streams)	10	Biotic community status	Biological assessment indicates impairment
127	Cadmium	520	Cadmium	More than one result in three-year period exceeds chronic aquatic criterion (CAC) defined in Indiana's water quality standards
137	Chlordane	200	Pesticides	Refers to Chlordane, Endrin, or DDT; more than one result in three-year period exceeds chronic aquatic criterion (CAC) defined in Indiana's water quality standards
138	Chloride	1330	Chlorides	Chloride anion concentration exceeds Indiana's water quality standards
139	Chlorine	700	Chlorine	Not used
154	Chromium (total)	540	Chromium	More than one result in three-year period exceeds chronic aquatic criterion (CAC) defined in Indiana's water quality standards
155	Chromium, hexavalent	540	Chromium	More than one result in three-year period exceeds chronic aquatic criterion (CAC) defined in Indiana's water quality standards
156	Chromium, trivalent	540	Chromium	More than one result in three-year period exceeds chronic aquatic criterion (CAC) defined in Indiana's water quality standards
168	Cyanide	720	Cyanide	Free cyanide in waterbodies within the Great Lakes watersheds; Total cyanide in other Indiana waterbodies
177	DDT	200	Pesticides	No waters listed specifically for DDT at time of data migration; any impairments for this parameter would have been listed as pesticides.
205	Dissolved oxygen saturation	1220	Low DO	Dissolved oxygen concentrations do not meet Indiana's water quality standards.

ADBv2 CAUSE ID*	ADBv2 CAUSE NAME	IDEM CAUSE (CAUSE CODE in ADBv1)	IDEM CAUSE NAME (CAUSENAME in ADBv1)	IDEM CAUSE DEFINITION
213	Endrin	200	Pesticides	Refers to Chlordane, Endrin, or DDT; more than one result in three-year period exceeds chronic aquatic criterion (CAC) defined in Indiana's water quality standards
214	Endrin aldehyde	200	Pesticides	Refers to Chlordane, Endrin, or DDT; more than one result in three-year period exceeds chronic aquatic criterion (CAC) defined in Indiana's water quality standards
217	Bacteria, Escherichia coli	1700	Pathogens	E. coli concentration exceeds Indiana's water quality standards
227	Excess Algal Growth	2210	Algal Growth/Chlorophyll a	Aquatic plant or algal growth that creates a nuisance, is unsightly, or otherwise impairs a designated use
230	Fishes Bioassessments (Streams)	10	Biotic community status	Biological assessment indicates impairment
243	Habitat Assessment (Streams)	1600	Other Habitat Alterations	Habitat alterations in response to land use practice such as cattle in stream, dredging, channelization; not used to indicate low QHEI scores from habitat evaluations conducted in association with biological monitoring
267	Lead	550	Lead	More than one result in three-year period exceeds chronic aquatic criterion (CAC) defined in Indiana's water quality standards
301	Nickel	565	Nickel	More than one result in three-year period exceeds chronic aquatic criterion (CAC) defined in Indiana's water quality standards
317	Oil and Grease	1900	Oil and Grease	A legacy code no longer used to indicate impairment; PAH and Priority Organics are used instead when data is available
318	Other anthropogenic substrate alterations	1600	Other Habitat Alterations	Habitat alterations in response to land use practice such as cattle in stream, dredging, channelization; not used to indicate low QHEI scores from habitat evaluations conducted in association with biological monitoring

ADBv2 CAUSE ID*	ADBv2 CAUSE NAME	IDEM CAUSE (CAUSE CODE in ADBv1)	IDEM CAUSE NAME (CAUSENAME in ADBv1)	IDEM CAUSE DEFINITION
319	Other flow regime alterations	1500	Flow Alteration	Stream flow volume and/or duration has been altered by human activities
371	Sedimentation/Siltation	1100	Siltation	Imbeddedness and smothering of substrate in streams; Loss of depth in lakes
372	Selenium	570	Selenium	More than one result in three-year period exceeds chronic aquatic criterion (CAC) defined in Indiana's water quality standards
385	Sulfates	750	Sulfates	Sulfate anion concentration exceeds Indiana's water quality standards
388	Temperature, water	1400	Thermal Modifications	Water temperature conditions do not meet Indiana's water quality standards
399	Total Dissolved Solids	1320	TDS	Total dissolved solids exceeds Indiana's water quality standards. (Used in assessments made prior to 2006. Indiana's Water quality standards were revised in 2004 eliminating the numeric criteria for total dissolved solids.)
423	Zinc	580	Zinc	More than one result in three-year period exceeds chronic aquatic criterion (CAC) defined in Indiana's water quality standards
441	pH	1000	pH	Parameter is outside criteria range defined in Indiana's water quality standards
447	Polycyclic Aromatic Hydrocarbons (PAHs) (Aquatic Ecosystems)	310	PAHs	Polynuclear aromatic hydrocarbons
448	Nutrient/Eutrophication Biological Indicators	900	Nutrients	Inorganic nutrients driving physico/chemical stream imbalance
449	Organic Enrichment (Sewage) Biological Indicators	1210		Biological assessment or measured parameters indicate sewage or manure inputs
459	Taste and Odor	2000	Taste and Odor	Algae growth in drinking water reservoirs that requires additional treatment of raw water
463	Impairment Unknown	10	Biotic community status	Biological assessment indicates impairment

ADBv2 CAUSE ID*	ADBv2 CAUSE NAME	IDEM CAUSE (CAUSE CODE in ADBv1)	IDEM CAUSE NAME (CAUSENAME in ADBv1)	IDEM CAUSE DEFINITION
467	Mercury in Fish Tissue	560	Mercury	More than one result in three-year period exceeds chronic aquatic criterion (CAC) defined in Indiana's water quality standards
472	PCB in Fish Tissue	410	PCBs	Polychlorinated biphenyls
463	Impairment Unknown	300	Priority Organics	Parameter is defined as an organic priority pollutant.[2] Priority Organics are defined as organic substances that are identified as a priority pollutant in U.S. EPA's National Recommended Water Quality Criteria: 2002 (EPA-822-R-03-023).
99	Atrazine	250	Atrazine	Atrazine exceeds U. S. EPA 2001 aquatic life chronic criterion.[1] (From U. S. EPA's Notice of Availability of Draft Aquatic Life Criteria Document for Atrazine published in the Federal Register, September 26, 2001 (Vol. 66, No. 187, pages 49186-49188)).
203	Dioxin (including 2,3,7,8-TCDD)	420	Dioxins	Exceeds ORSANCO 2003 criterion for human health protection for the Ohio River[3] (From ORSANCO's 2003 Revision of its Pollution Control Standards for Discharges to the Ohio River. This standard was taken from U.S. EPA's recommended criteria for priority pollutants.)
91	Ammonia (Un-ionized)	600	Ammonia (Un-ionized)	Exceeds 1999 U. S. EPA ammonia criteria. USEPA's 1999 Update of Ambient Water Quality Criteria for Ammonia (EPA-822-R-99-014).[4] Although Indiana's water quality standards contain criteria for ammonia, the narrative language in the standards gives IDEM the authority to use the most up-to-date criteria. Because the 1999 U.S. EPA criteria are more current than those in the state's standards, Indiana uses the U.S. EPA criteria instead of state standards for ammonia in water quality assessments.

The following table defines the codes used in the Assessment Database to describe sources of water quality impairments:

ADBv2 SOURCE ID*	ADBv2 SOURCE NAME	IDEM Source Code in ADBv1	Closest Equivalent Source Code from ADBv1 SRCNAME List	IDEM Source Definition
56	Impacts from Abandoned Mine Lands (Inactive)	5900	Abandoned Mining	Inactive mine is source
2	Acid Mine Drainage	5800	Acid Mine Drainage	Low pH, high total dissolved solids and/or sulfates
156	Agriculture	1000	Agriculture	Major category included with farming activities (1050 and 1060); When used with or without additional agricultural source codes, source indicates that land use data show dominant land use is agriculture but more specific agricultural sources cannot be distinguished.
125	Streambank Modifications/destablization	7700	Bank or Shoreline Modification/Destabilization	Indicates human activities resutling in bank erosion and/or undercutting, including legal drain maintenance
20	Channelization	7100	Channelization	Straightening channel; destroying instream habitat
115	Sanitary Sewer Overflows (Collection System Failures)	500	Collection System Failure	Pump OR lift station overflow; sewer line break
23	Combined Sewer Overflows	400	Combined Sewer Overflows	Within CSO community or observed discharge
4	Animal Feeding Operations (NPS)	1640	Confined Animal Feeding Operations (nonpoint source)	When linked to E. coli impairments, this source is used in conjunction with 1050 to indicate nonpoint source pollution related to manure application from intensive animal feeding operations.

ADBv2 SOURCE ID*	ADBv2 SOURCE NAME	IDEM Source Code in ADBv1	Closest Equivalent Source Code from ADBv1 SRCNAME List	IDEM Source Definition
28	Contaminated Sediments	8500	Contaminated Sediments	Legacy contaminants in sediments; no associated point source
144	Crop Production (Crop Land or Dry Land)	1050	Crop-Related Sources	Land use is row crops as indicated by land use data; when linked to E. coli impairments, this source is used in conjunction with 1640 to indicate nonpoint source manure application from intensive animal feeding operations.
19	Channel Erosion/Incision from Upstream Hydromodifications	7300	Dam Construction	Altered habitat
51	Historic Bottom Deposits (Not Sediment)	8520	Debris and bottom deposits	Indicates human activities that have altered the stream bottom
37	Dredge Mining	5400	Dredge Mining	Not Used
38	Dredging (E.g., for Navigation Channels)	7200	Dredging	Removing instream habitat
42	Flow Alterations from Water Diversions	7400	Flow Regulation/Modification	Stream discharge is altered by means other than diversion of water into upstream impoundment
50	Highways, Roads, Bridges, Infrasturcture (New Construction)	3100	Highway/Road/Bridge Construction	Road construction, including bridges
55	Illicit Connections/Hook-ups to Storm Sewers	4400	Illicit connections/illegal hook-ups/dry weather flows	Straight pipes, unpermitted discharges
54	Illegal Dumps or Other Inappropriate Waste Disposal	6350	Inappropriate Waste Disposal/Wildcat Dumping	Unpermitted landfill or disposal site
62	Industrial Point Source Discharge	100	Industrial Point Sources	NPDES-permitted industrial facility

ADBv2 SOURCE ID*	ADBv2 SOURCE NAME	IDEM Source Code in ADBv1	Closest Equivalent Source Code from ADBv1 SRCNAME List	IDEM Source Definition
63	Industrial Thermal Discharges	100	Industrial Point Sources	NPDES-permitted industrial facility
122	Site Clearance (Land Development or Redevelopment)	3200	Land Development	Residential or industrial construction acitivities
69	Landfills	6300	Landfills	Permitted landfill
143	Livestock (Grazing or Feeding Operations)	1060	Livestock	Land use is grazing, animal feeding; when linked to E. coli impairments, this source is used in conjunction with with 1640 to indicate nonpoint source manure application from intensive animal feeding operations.
174	Unrestricted Cattle Access	1060	Livestock	Land use is grazing, animal feeding; when linked to E. coli impairments, this source is used to indicate nonpoint source pollution from pastured areas in/near riparian zone as indicated by land use data and/or observations of livesotck in stream.
85	Municipal Point Source Discharges	200	Municipal Point Sources	NPDES-permitted municipal facility; includes both major and minor municipal (public) facilities
136	Wildlife Other than Waterfowl	8600	Natural Sources	Naturally occurring sources/stressors; When linked to E. coli, indicates wildlife sources
155	Natural Sources	8600	Natural Sources	Naturally occurring sources/stressors; When linked to E. coli, indicates wildlife sources
141	Non-Point Source	8960	Nonpoint Source/Unknown Origin	Nonpoint sources; When used without point source codes, this source indicates that there are no permitted facilities upstream and that nonpoint source is most likely source

ADBv2 SOURCE ID*	ADBv2 SOURCE NAME	IDEM Source Code in ADBv1	Closest Equivalent Source Code from ADBv1 SRCNAME List	IDEM Source Definition
92	On-site Treatment Systems (Septic Systems and Similar Decencentralized Systems)	6500	Onsite Wastewater Treatment Systems (septic tanks)	Leaking septic tanks; When linked to E. coli impaimrenbt, this source is used to indicate point source pollution related to septic tanks; Source applicable only in rural, unsewered areas. **Note: This description was incorrect in the 2006 IR. This source applies specifically to nonpoint sources of pollution attributable to septic systems, not point sources. Illicit Connections (Source Code 4400) was used in ADBv1 to indicate point sources (straightpipes) of impairment from septic systems.**
64	Industrial/Commercial Site Stormwater Discharge (Permittted)	4300	Other Urban Runoff	Overland and unknown residential; urban source
169	Unspecified Urban Stormwater	4300	Other Urban Runoff	Overland and unknown residential; urban source
177	Urban Runoff/Storm Sewers	4300	Other Urban Runoff	Overland and unknown residential; urban source
84	Municipal (Urbanized High Density Area)	4300	Overland and unknown residential; urban source	Overland and unknown residential; urban source
99	Package Plant or Other Permitted Small Flows Discharges	230	Package Plants (small flows)	NPDES semi-public facility
72	Loss of Riparian Habitat	7600	Removal of riparian vegetation	Indicates human activities resulting in removal of riparian vegetation (bushes, trees) including legal drain maintenance; also used to indicate row crops to bank edge or bare soil on banks

ADBv2 SOURCE ID*	ADBv2 SOURCE NAME	IDEM Source Code in ADBv1	Closest Equivalent Source Code from ADBv1 SRCNAME List	IDEM Source Definition
102	Petroleum/natural Gas Activities	5500	Resource Extraction	Major category for mining activities (5000 and 5900)
103	Petroleum/natural Gas Production Activities (Permitted)	5500	Resource Extraction	Major category for mining activities (5000 and 5900)
118	Silviculture - Large Scale (Industrial) Unpermitted Forestry	2000	Silviculture	
119	Silviculture Harvesting	2000	Silviculture	
120	Silviculture Plantation Management	2000	Silviculture	
121	Silviculture Reforestation	2000	Silviculture	
33	Discharges from Biosolids (SLUDGE) Storage, Application or Disposal	6100	Sludge	Land application of sludge
140	Source Unknown	9000	Source Unknown	Associated with fish consumption advisories and lake impairments
142	Dam or Impoundment	7350	Upstream Impoundment	Stream discharge is altered by diversion of water into upstream impoundment

APPENDIX E: IDEM'S 305(b)/303(d) MONITORING, ASSESSMENT, REPORTING AND LISTING SCHEDULE

IDEM'S 305(b)/303(d) Rotating Basin Monitoring, Assessment, Reporting and Listing Schedule

Sequence in Rotating Basin Monitoring Strategy	Basin(s)	Year Monitored	Year Assessed	Year Reported	Type of 305(b) Report Submitted to EPA	Year Impairments Placed on 303(d) List
1	White River, West Fork Basin and Patoka River - Probabilistic	2001	2002	2003	Electronic Update	2004
NA	No new basin assessments; narrative updated with assessment results for White River, West Fork Basin and Patoka River	NA	NA	2004	Integrated Report	NA
2	White River, East Fork, Basin and Whitewater River Basin - Probabilistic	2002	2004	2005	Electronic Update	2006
3	Upper Wabash River Basin - Probabilistic White River, East Fork, Basin and Whitewater River Basin - Source ID	2003	2005			
NA	No new basin assessments; narrative updated with assessment results for White River, East Fork Basin, Whitewater River Basin, and Upper Wabash Basin	NA	NA	2006	Integrated Report	NA
4	Lower Wabash River Basin and Kankakee River Basin - Probabilistic Upper Wabash River Basin - Source ID	2004	2006	2007	Electronic Update	2008
5	Great Lakes Basin and Ohio River Basin - Probabilistic Lower Wabash River Basin and Kankakee River Basin - Source ID	2005	2007	2008	Integrated Report	
1	White River, West Fork Basin and Patoka River - Probabilistic Great lakes Basin and Ohio River Basin - Source ID	2006	2008	2009	Electronic Update	2010
2	White River, East Fork, Basin and Whitewater River Basin - Probabilistic White River, West Fork Basin and Patoka River - Source ID	2007	2009	2010	Integrated Report	
3	Upper Wabash River Basin - Probabilistic White River, East Fork, Basin and Whitewater River Basin - Source ID	2008	2010	2011	Electronic Update	2012
4	Lower Wabash River Basin and Kankakee River Basin - Probabilistic Upper Wabash River Basin - Source ID	2009	2011	2012	Integrated Report	
5	Great Lakes Basin and Ohio River Basin - Probabilistic Lower Wabash River Basin and Kankakee River Basin - Source ID	2010	2012	2013	Electronic Update	2014
1	White River, West Fork Basin and Patoka River - Probabilistic Great Lakes Basin and Ohio River Basin - Source ID	2011	2013	2014	Integrated Report	

[a]In accordance with IDEM's rotating basin monitoring strategy, probabilistic monitoring is conducted 1-2 of the state's major basins each year so that monitoring can be completed for the entire state every five years. In addition to probabilistic monitoring, IDEM's Source ID Program aimed at identifying specific sources of impairment began in 2003 with the Upper Wabash River Basin.

[b]Per Indiana Code 13-18-2-3 impairments identified through IDEM's assessment process and placed on Indiana's 303(d) List of Impaired Waters must be made available for 90-day public comment period prior to submission of the list to U.S. EPA. Because assessments made during a listing year occur after the draft 303(d) list is published for public comment, any impairments identified are held for the next listing cycle to ensure that they are made available for public comment. Therefore, assessments made during a listing year are reported in the electronic update the following year and placed on the draft 303(d) list during the next scheduled listing cycle. This timeline was implemented beginning with the 2006 303(d) listing cycle, during which the 303(d) list was revised with all assessments completed prior to 2006.

[c]The Integrated Report consists of a narrative water quality report (formerly known as the 305(b) Report) and Indiana's Consolidated List, which includes the 303(d) List of Impaired Waters. The Integrated Report is required by U.S. EPA biannually in even-numbered years. In odd-numbered years, IDEM submits a copy of its Assessment Database to U.S. EPA as an electronic update.

APPENDIX F: EXTERNAL DATA SOLICITATION LETTER

INDIANA DEPARTMENT OF ENVIRONMENTAL MANAGEMENT
We make Indiana a cleaner, healthier place to live.

Mitchell E. Daniels, Jr.
Governor

Thomas W. Easterly
Commissioner

100 North Senate Avenue
Indianapolis, Indiana 46204
(317) 232-8603

January 10, 2007

Dear Colleague:

Re: Request for Water Quality Information

The Indiana Department of Environmental Management, Office of Water Quality (OWQ) is preparing to update water quality assessments for Indiana watersheds. We are looking forward to your assistance in this endeavor. **We are requesting any existing and readily available water quality reports and/or assessments, using samples collected on or after January 1, 2000**. Reports on water, sediment, biota, biological communities and habitat that assess the quality of Indiana lakes and streams would be most useful.

The information received will be prioritized and reviewed for potential use in updating Indiana water quality assessments. Updated assessments will be reported in the 2008 Integrated Water Monitoring and Assessment Report (formerly known as the 305(b) Report) and will be used to evaluate impaired waters for inclusion on Indiana's 303(d) List of Impaired Waters. Both the Integrated Water Monitoring Assessment Report and the 303(d) List of Impaired Waters will be submitted to USEPA in 2008.

The deadline to submit data and information for consideration in the 2008 305(b) assessment and 303(d) listing cycle **is March 31, 2007**. The following criteria are intended to provide an efficient means of submitting data that is representative of existing stream or lake conditions. For water quality data and information to be considered, submittals should follow these guidelines:

- All submittals must include organization name, contact information including phone number, mailing address, and email address (if available).
- Submissions including water quality data should include a description of sampling locations, sampling dates and times, the parameters measured and the results, measurement units for each parameter, field methods and laboratory methods used and any data qualifiers used. Please note that data should not be edited or adjusted but should include the entire data set that was collected.
- Documentation of the quality assurance methods used in collecting, analyzing and reporting the data should be included if available for any numeric chemical, physical, and/or biological data submitted.
- Quality control results that are stored with or are an integral part of the dataset should be included when available. Submitters whose results indicate impairment may be requested to provide more complete quality assurance information and quality control data during the review process.
- Numeric data should be submitted in electronic format such as flat files (e.g. Microsoft Excel spreadsheets) or database formats (generated in Microsoft Access or other database software).
- Geospatial data (e.g. sampling locations) in electronic format is preferred. If you do not have electronic geographical information system (GIS) capabilities, you may instead submit sampling locations marked on a USGS 7.5 minute quadrangle map, a map from the Indiana Atlas and Gazetteer, or a county planning map. A table providing Global Positioning Unit (GPS) locations is also acceptable providing the units of location are indicated.

- Journal or published articles may be submitted in either electronic or hardcopy format. However, electronic format is preferred for any numeric data included as part of the submission.
- Indicate the experience level of the people conducting the sampling and analyses (e.g. professional, adult volunteers, college, high school, grade school, etc.) and their level of training.

All data and information must be scientifically sound and defensible as determined by IDEM staff. Information received will not be used for 305(b) assessment and 303(d) listing processes until they have been reviewed for their usability and their data quality assured. Information must be submitted in electronic format to be considered readily available for review. Data and information received before March 31, 2007 will be prioritized for review based on IDEM's five-year rotating basin schedule for 305(b) monitoring, assessment, reporting and 303(d) listing:

Basin	Assessment Year	Integrated Report	303(d) List
Lower Wabash River Basin and Kankakee River Basin	2006	2008	2008
Great Lakes Basin and Ohio River Basin	2007	2008	2008
White River, West Fork Basin and Patoka River Basin	2008	2010	2010
White River, East Fork Basin and Whitewater River Basin	2009	2010	2010
Upper Wabash River Basin	2010	2012	2012

Data collected by IDEM for the Lower Wabash and Kankakee River Basins was assessed in 2006. Data and information submitted for these and other basins included in the 2008 integrated reporting and 303(d) listing cycle will receive highest priority for review. Data and information received after March 31, 2007 and all hard copy submissions will be reviewed as time allows. These data and information will be considered for the next scheduled reporting and listing cycle following their review.

Please send any assessments, reports, or monitoring results that you believe may be useful in updating Indiana water quality assessments to:

Jody Arthur 305(b)/303(d) Coordinator
100 N. Senate Ave. IGCN (1255)
Indianapolis, IN 40204-2251

Electronic submittals should be sent to: jarthur@idem.IN.gov. It is recommended that exceptionally large files also be submitted on a compact disc (CD) via regular mail.

Questions regarding this solicitation may be directed to Jody Arthur, 305(b)/303(d) Coordinator in the Office of Water Quality at IDEM at 317-234-1424 or 800-451-6027. Ms. Arthur can also be reached by email at jarthur@idem.IN.gov.

Sincerely,

Martha Clark Mettler,
Deputy Assistant Commissioner
Office of Water Quality

Addendum 1: Indiana's long term TMDL development schedule.

The 303(d) list of Impaired Waters identifies waterbodies in Indiana that require a TMDL. The CWA does not clearly define the timeline for TMDL development. However, U.S. EPA's most recent guidance (U.S EPA, 2005) recommends that states develop expeditious schedules of eight (8) to thirteen (13) years from the date of original listing. A schedule for TMDL development over the next two years was provided in Attachment C of the 303(d) list materials in Indiana's 2008 Integrated Report submission. This schedule may be modified in future cycles. IDEM intends to make every reasonable attempt to address impairments as they appear in this schedule. However, IDEM will continue to make adjustments to this schedule as necessary given new logistical efficiencies, the availability of data, and any resource and policy constraints or other limitations that may occur in the future. U.S. EPA does not approve or disapprove IDEM's TMDL development schedule. Rather, the two-year schedule and the long term TMDL development schedule presented here are intended to help the public and EPA understand the state's priorities and assist in IDEM planning.

In general, IDEM's TMDL development schedule corresponds with IDEM's rotating basin monitoring schedule unless there is a significant reason to deviate from that schedule. This strategy allows IDEM to take advantage of all available resources for TMDL development by targeting 303(d)-listed waters in a given basin for additional monitoring as sampling crews are working in that basin.

The priority ranking provided in the long term schedule should not be interpreted as any policy decision regarding the relative importance of one type of impairment compared to another. Rather, the priority ranking reflects the progress IDEM has made in developing scientifically sound and cost effective approaches to TMDL development.

All pathogen impairments have been ranked as high priority. IDEM's process for developing E. coli TMDLs has been refined to the point that TMDLs for pathogen impairments can be completed in a relatively short timeframe, particularly as data becomes available through IDEM's basin-rotation monitoring.

Fish tissue impairments are ranked as a low priority because IDEM maintains that a TMDL is not the appropriate approach for addressing these impairments and to date, EPA has not provided adequate guidance to states regarding how to develop a TMDL to restore a waterbody with fish tissue impairments. Until better guidance is available, IDEM considers it more prudent to focus limited resources on developing TMDLs for which appropriate methods have been established.

All other impairments have been ranked as medium priority. IDEM has completed TMDLs for a number of the types of impairments ranked as medium priority and continues to work to refine These impairments vary to the extent that TMDL development is done on a case-by-case basis based on 1) the amount of readily available and representative data; 2) relative complexity and ability to characterize the impairment; and, 3) local interest in the watershed (e.g. active watershed groups).

Waterbody-Specific Notes:

*Although the Grand Calumet River appears on this schedule, IDEM has determined that a TMDL is not the appropriate means for addressing the impairments to this waterbody. IDEM instead supports and is actively participating in the multi-agency restoration effort presently underway for the Grand Calumet River. Due to its large scale and comprehensive scope, this restoration effort is expected to achieve far greater gains in a shorter timeframe than TMDL development can.

**The TMDL to address the pathogen impairment of the Ohio River main stem is currently under development. U.S. EPA has funded and is leading this effort through Ohio River Valley Water Sanitation Commission (ORSANCO). This TMDL is anticipated to be completed in 2009 at which time, IDEM will propose placement of these impairments into Category 4A of its Consolidated Listing.

Addendum 1: Indiana's long term TMDL development schedule.
